# **Complex Numbers and Quadratic Equations**

- A number of the form a + ib, where a and b are real numbers and  $i = \sqrt{-1}$ , is defined as a complex number.
- For the complex numbers *z* = *a* + *ib*, *a* is called the real part (denoted by Re *z*) and *b* is called the imaginary part (denoted by Im *z*) of the complex number *z*.

**Example**: For the complex number  $Z = \frac{-5}{9} + i \frac{\sqrt{3}}{17}$ , Re  $Z = \frac{-5}{9}$  and Im  $Z = \frac{\sqrt{3}}{17}$ 

• Two complex numbers  $z_1 = a + ib$  and  $z_2 = c + id$  are equal if a = c and b = d.

# • Addition of complex numbers

Two complex numbers  $z_1 = a + ib$  and  $z_2 = c + id$  can be added as,  $z_1 + z_2 = (a + ib) + (c + id) = (a + c) + i(b + d)$ 

### • Properties of addition of complex numbers:

- **Closure Law:** Sum of two complex numbers is a complex number. In fact, for two complex numbers  $z_1$  and  $z_2$ , such that  $z_1 = a + ib$  and  $z_2 = c + id$ , we obtain  $z_1 + z_2 = (a + c) + i(b + d)$ .
- **Commutative Law:** For two complex numbers  $z_1$  and  $z_2$ ,

 $z_1 + z_2 = z_2 + z_1$ .

• **Associative Law:** For any three complex numbers *z*<sub>1</sub>, *z*<sub>2</sub> and *z*<sub>3</sub>,

 $(z_1 + z_2) + z_3 = z_1 + (z_2 + z_3).$ 

- **Existence of Additive Identity:** There exists a complex number 0 + i0 (denoted by 0), called the additive identity or zero complex number, such that for every complex number z, z + 0 = z.
- **Existence of Additive Inverse:** For every complex number z = a + ib, there exists a complex number -a + i(-b) [denoted by -z], called the additive inverse or negative of z, such that z + (-z) = 0.

## • Subtraction of complex numbers

Given any two complex numbers  $z_1$ , and  $z_2$ , the difference  $z_1 \square z_2$  is defined as  $z_1 - z_2 = z_1 + (-z_2)$ .

• Multiplication of complex numbers:

Two complex numbers  $z_1 = a + ib$  and  $z_2 = c + id$  can be multiplied as,  $z_1 z_2 = (ac - bd) + i(ad + bc)$ 

- Properties of multiplication of complex numbers:
- **Closure law:** The product of two complex numbers is a complex number.

In fact, for two complex numbers  $z_1$  and  $z_2$ , such that  $z_1 = a + ib$  and  $z_2 = c + id$ , we obtain  $z_1 z_2 = (ac - bd) + i(ad + bc)$ .

- **Commutative Law:** For any two complex numbers  $z_1$  and  $z_2$ ,  $z_1z_2 = z_2z_1$ .
- $\circ$  Associative Law: For any three complex numbers  $z_1$ ,  $z_2$  and  $z_3$ ,

 $(z_1z_2) z_3 = z_1 (z_2z_3).$ 

- **Existence of Multiplicative Identity:** There exist a complex number 1 + i 0 (denoted as 1), called the multiplicative identity, such that for every complex numbers z, z. 1 = z.
- **Existence of Multiplicative Inverse:** For every non-zero complex number z = a + ib ( $a \neq 0, b \neq 0$ ), we have the complex number

 $\frac{a}{a^2+b^2} + i\frac{-b}{a^2+b^2}$  (denoted by  $\frac{1}{z}$  or  $z^{-1}$ ), called the multiplicative inverse of z, such that  $z \frac{1}{z} = 1$ .

**Example:** The multiplicative inverse of the complex number z = 2 - 3i can be found as,  $z^{-1} = \frac{2}{(2)^2 + (-3)^2} + i \frac{(-3)}{(2)^2 + (-3)^2} = \frac{2}{13} - \frac{3}{13}i$ 

- **Distributive Law:** For any three complex numbers *z*<sub>1</sub>, *z*<sub>2</sub> and *z*<sub>3</sub>,
- $Z_1(Z_2 + Z_3) = Z_1Z_2 + Z_1Z_3$
- $(Z_1 + Z_2) Z_3 = Z_1 Z_3 + Z_2 Z_3$
- Division of Complex Numbers

Given any two complex number  $z_1$  and  $z_2$ , where  $z_2 \neq 0$ , the quotient  $\frac{z_1}{z_2}$  is defined as  $\frac{z_1}{z_2} = z_1 \frac{1}{z_2}$ 

**Example:** For  $z_1 = 1 + i$  and  $z_2 = 2 - 3i$ , the quotient  $\overline{z_2}$  can be found as,

$$\begin{aligned} \frac{z_1}{z_2} &= \frac{1+i}{2-3i} \\ &= \left(1+i\right) \left(\frac{1}{2-3i}\right) \\ &= \left(1+i\right) \left(\frac{2}{(2)^2+(-3)^2} + i\frac{(-3)}{(2)^2+(-3)^2}\right) \\ &= \left(1+i\right) \left(\frac{2}{13} - \frac{3}{13}i\right) \\ &= \left[1 \times \frac{2}{13} - 1 \times \left(-\frac{3}{13}\right)\right] + i \left[1 \times \left(-\frac{3}{13}\right) + 1 \times \frac{2}{13}\right] \\ &= \frac{5}{13} - \frac{1}{13}i \end{aligned}$$

• **Property of Complex Numbers** • For any integer k,  $i^{4k} = 1$ ,  $i^{4k+1} = i$ ,  $i^{4k+2} = -1$ ,  $i^{4k+3} = -i$ .

• If *a* and *b* are negative real numbers, then

#### Modulus of a Complex Number •

The modulus of a complex number z = a + ib, is denoted by |z|, and is defined as the nonnegative real number  $\sqrt{a^2 + b^2}$ , i.e.,  $|z| = \sqrt{a^2 + b^2}$ . **Example 1:** If z = 2 - 3i, then  $|z| = \sqrt{(2)^2 + (-3)^2} = \sqrt{13}$ 

#### **Conjugate of Complex Number** •

The conjugate of a complex number z = a + ib, is denoted by  $\overline{Z}$ , and is defined as the complex number a - ib, i.e.,  $\overline{z} = a - ib$ .

**Example 2:** Find the conjugate of  $\frac{2}{3+5i}$ .

Solution: We have

$$\frac{2}{3+5i}$$

$$= \frac{2}{3+5i} \times \frac{3-5i}{3-5i}$$

$$= \frac{2(3-5i)}{(3)^2 - (5i)^2}$$

$$= \frac{2(3-5i)}{9-25i^2}$$

$$= \frac{6-10i}{9+25} \quad (\because i^2 = -1)$$

$$= \frac{6-10i}{34}$$

$$= \frac{6}{34} - \frac{10i}{34}$$

$$= \frac{3}{17} - \frac{5i}{17}$$
Thus, the conjugate of  $\frac{2}{3+5i}$  is  $\frac{3}{17} + \frac{5}{17}$ 

<u>5i</u> 17. Thus, the conjugate of  $\frac{2}{3+5i}$  is  $\frac{3}{17}$ 

Properties of modulus and conjugate of complex numbers: •

For any three complex numbers *z*, *z*<sub>1</sub>, *z*<sub>2</sub>,

$$z^{-1} = \frac{\overline{z}}{|z|^2} \text{ or } z.\overline{z} = |z|^2$$
  

$$|z_1 z_2| = |z_1| |z_2|$$
  

$$|\frac{z_1}{z_2}| = \frac{|z_1|}{|z_2|}, \text{ provided } |z_2| \neq 0$$
  

$$\frac{\overline{z_1 z_2}}{z_1 \pm z_2} = \overline{z_1} \overline{z_2}$$

.

#### Solutions of the quadratic equation when D < 0. •

The solutions of the quadratic equation  $ax^2 + bx + c = 0$ , where  $a, b, c \in \mathbb{R}$ ,  $a \neq 0$  are given by  $x = \frac{-b \pm \sqrt{D}}{2a}$ , where  $D = b^2 - 4ac < 0$ .

**Example:** Solve  $2x^2 + 3ix + 2 = 0$ 

**Solution:** Here *a* = 2, *b* = 3*i* and *c* = 2

$$D = b^{2} - 4ac$$

$$= (3i)^{2} - 4 \times 2 \times 2$$

$$= -9 - 16$$

$$= -25 < 0$$

$$\therefore x = \frac{-b \pm \sqrt{D}}{2a}$$

$$\Rightarrow x = \frac{-3i \pm \sqrt{-25}}{2 \times 2}$$

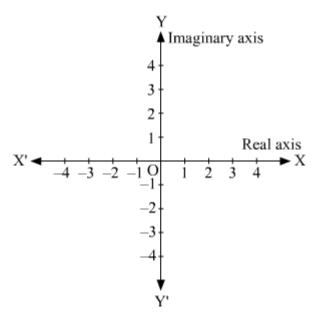

$$\Rightarrow x = \frac{-3i \pm 5i}{4}$$

$$\Rightarrow x = \frac{-3i \pm 5i}{4} \text{ or } x = \frac{-3i - 5i}{4}$$

$$\Rightarrow x = \frac{2i}{4} \text{ or } x = -\frac{8i}{4}$$

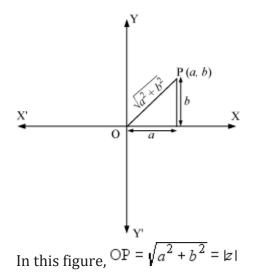

$$\Rightarrow x = \frac{1}{2} \text{ or } x = -2i$$

• **Argand plan:** Each complex number represents a unique point on Argand plane. An Argand plane is shown in the following figure.

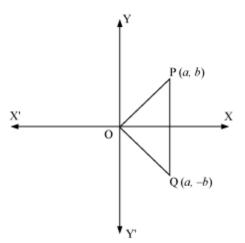

Here, *x*-axis is known as the **real axis** and *y*-axis is known as the **imaginary axis**.

• **Complex Number on Argand plane:** The complex number *z* = *a* + *ib* can be represented on an Argand plane as

- •
- .Thus, the modulus of a complex number z = a + ib is the distance between the point P(x, y) and the origin 0.
- Conjugate of Complex Number on Argand plane:
- The conjugate of a complex number z = a + ib is  $\overline{z} = a ib$ , z and  $\overline{z}$  can be represented by the points P(a, b) and Q(a, -b) on the Argand plane as

Thus, on the Argand plane, the conjugate of a complex number is the mirror image of the complex number with respect to the real axis.

### • Polar representation of Complex Numbers

The polar form of the complex number z = x + iy, is  $r(\cos \theta + \sin \theta)$  where  $r = \sqrt{x^2 + \gamma^2}$  (modulus of z) and  $\cos \theta = \frac{x}{r}$ ,  $\sin \theta = \frac{\gamma}{r}$  ( $\theta$  is known as the argument of z). The value of  $\theta$  is such that  $-\pi < \theta \le \pi$ , which is called the principle argument of z. **Example 2:** Represent the complex number  $z = \sqrt{2} - i\sqrt{2}$  in polar form.

Solution: 
$$z = \sqrt{2} - i\sqrt{2}$$
  
Let  $\sqrt{2} = r \cos \theta_{\text{and}} - \sqrt{2} = r \sin \theta$   
By squaring and adding them, we have  
 $2 + 2 = r^2 \left(\cos^2 \theta + \sin^2 \theta\right)$   
 $\Rightarrow r^2 = 4$   
 $\Rightarrow r = \sqrt{4} = 2$   
Thus,  
 $\cos \theta = \frac{\sqrt{2}}{2} = \frac{1}{\sqrt{2}}$   
 $\sin \theta = \frac{\sqrt{2}}{2} = \frac{-1}{\sqrt{2}} = \sin \left(2\pi - \frac{\pi}{4}\right)$   
 $\Rightarrow \theta = 2\pi - \frac{\pi}{4} = \frac{7\pi}{4}$   
Thus, the required polar form is  $2\left(\cos \frac{7\pi}{4} + \sin \frac{7\pi}{4}\right)$ .
