# 

## Aim

To find the downward force, along an inclined plane, acting on a roller due to gravity and study its relationship with the angle of inclination by plotting graph between force and  $\sin \theta$ .

### APPARATUS AND MATERIAL REQUIRED

Inclined plane with protractor and pulley, roller, weight box, spring balance, spirit level, pan and thread.

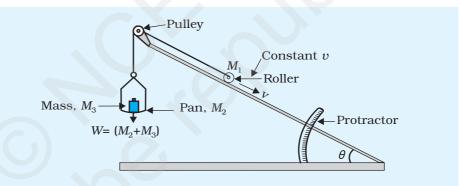

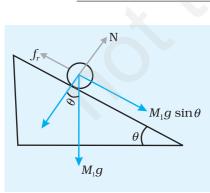

Fig. E 8.1: Experimental set up to find the downward force along an inclined plane

RINCIPI

Consider the set up shown in Fig. E 8.1. Here a roller of mass  $M_1$  has been placed on an inclined plane making an angle  $\theta$  with the horizontal. An upward force, along the inclined plane, could be applied on the mass  $M_1$  by adjusting the weights on the pan suspended with a string while its other end is attached to the mass through a pulley fixed at the top of the inclined plane. The force on the the mass  $M_1$  when it is moving with a constant velocity v will be

$$W = M_{I}g \sin \theta - f_{r}$$

where  $f_r$  is the force of friction due to rolling,  $M_1$  is mass of roller and W is the total tension in the string

Fig. E 8.2: Free body diagram

(W = weight suspended). Assuming there is no friction between the pulley and the string.

# ROCEDURE

- 1. Arrange the inclined plane, roller and the masses in the pan as shown in Fig. E. 8.1. Ensure that the pulley is frictionless. Lubricate it using machine oil, if necessary.
- 2. To start with, let the value of *W* be adjusted so as to permit the roller to stay at the top of the inclined plane at rest.
- 3. Start decreasing the masses in small steps in the pan until the roller just starts moving down the plane with a constant velocity. Note *W* and also the angle  $\theta$ . Fig. E 8.2 shows the free body diagram for the situation when the roller just begins to move downwards.
- 4. Repeat steps 2 and 3 for different values of  $\theta$ . Tabulate your observations.

#### UBSERVATIONS

Acceleration due to gravity, $g$	$= \dots N/m^2$
Mass of roller, <i>m</i>	$= (M_1)$ g
Mass of the pan	$= (M_2)$ g

#### Table E 8.1

S. No.	θ	$\sin \theta$	Mass added to pan $M_3$	Force $W = (M_2 + M_3) g$ (N)
1	$\sim$			
2	$\sim$			
3				

LOTTING GRAPH

Plot graph between  $\sin \theta$  and the force *W* (Fig. E 8.3). It should be a straight line.

**Fig. E 8.3:** Graph between W and  $\sin \theta$
