	Grundina	ary Thinking
		Objective Questions
	Thermo	ometry
1.	On the Celsius scale the absolut	te zero of temperature is at
		[CBSE PMT 1994]
	(a) $0^{\circ}C$	(b) $-32^{\circ}C$
	(c) $100^{\circ}C$	(d) $-273.15^{\circ}C$
2.	Oxygen boils at – 183° <i>C</i> . This te	emperature is approximately
		[CPMT 1992]
	(a) 215° <i>F</i>	(b) – 297° <i>F</i>
	(c) 329° <i>F</i>	(d) 361° <i>F</i>
3.	Recently, the phenomenon of s at 95 K. This temperature is ne	superconductivity has been observed arly equal to
		[CPMT 1990]
	(a) $-288^{\circ}F$	(b) $-146^{\circ}F$
	(c) $-368^{\circ}F$	(d) +178°F
4.	The temperature of a substand scale this increase is equal to	ce increases by 27° <i>C</i> . On the Kelvin [CPMT 1993]
	(a) 300 K	(b) 2.46 <i>K</i>
	(c) 27 K	(d) 7 <i>K</i>
5.	The resistance of a resistance t <i>ohm</i> at 10° <i>C</i> and 100° <i>C</i> . The te 3.26 <i>ohm</i> is	hermometer has values 2.71 and 3.70 emperature at which the resistance is [CPMT 1994]
	(a) 40° <i>C</i>	(b) 50° <i>C</i>
	(c) 60° <i>C</i>	(d) 70° <i>C</i>
6	No other thermometer is as	suitable as a platinum resistance

**6.** No other thermometer is as suitable as a platinum resistance thermometer to measure temperature in the entire range of

[MNR 1993]

(a)	0° <i>C</i> to 100° <i>C</i>	(b)	100° <i>C</i> to 1500° <i>C</i>
(c)	$-50^{\circ}C$ to $+350^{\circ}C$	(d)	- 200° $C$ to 600° $C$

7.	The temperature of the sun is [ <b>Pb.</b> 1	measured with PMT 1998; CPMT 1998; Pb. PET 1997, 2001]	18.	One quality of a thermom small. If <i>P</i> is a mercury ther and <i>R</i> thermocouple type th	eter is that its heat capacity should be rmometer, <i>Q</i> is a resistance thermometer en <b>[CPMT 1997</b> ]
	(a) Platinum thermometer			(a) $P$ is best, $R$ worst	(b) $R$ is best, $P$ worst
	(b) Gas thermometer			(c) $R$ is best, $Q$ worst	(d) $P$ is best, $Q$ worst
	(c) Pyrometer		19.	Two thermometers are used	to record the temperature of a room. If
	(d) Vapour pressure thermore	neter		the bulb of one is wrapped	in wet hanky
8.	Absolute temperature can be o	calculated by [AFMC 1994]			[AFMC 1997]
	(a) Mean square velocity	(b) Motion of the molecule		(a) The temperature recor	ded by both will be same
٩	(c) Both (a) and (b) Thermoelectric thermometer i	(d) None of the above		(b) The temperature reco greater than that recor	rded by wet-bulb thermometer will be ded by the other
<i>.</i>		[CPMT 1993, 95; AFMC 1998]		(c) The temperature reco greater than that recor	rded by dry-bulb thermometer will be ded by the other
	(a) Photoelectric effect	(b) Seeback effect		(d) None of the above	,
	(c) Compton effect	(d) Joule effect	20.	The temperature of a body	on Kelvin scale is found to be $x K$ . When
10.	Maximum density of $H_2O$ is	at the temperature		it is measured by Fahrenh then the value of <i>x</i> is	eit thermometer, it is found to be $x^{\circ}F$ ,
		[CPMT 1996; Pb. PMT 1996]			[UPSEAT 2000; Pb. CET 2004]
	(a) 32° <i>F</i>	(b) 39.2° <i>F</i>		(a) 40	(b) 313
	(c) $42^{\circ}F$	(d) 4° <i>F</i>		(c) 574.25	(d) 301.25
11.	The study of physical pheno liquid nitrogen temperature) i	omenon at low temperatures (below s called [ <b>CPMT 1992</b> ]	21.	A centigrade and a Fahren	heit thermometer are dipped in boiling
	(a) Refrigeration	(b) Radiation		thermometer registers 140	°. What is the fall in temperature as
	(c) Cryogenics	(d) Pyrometry		registered by the Centigrade	e thermometer
12.	'Stem Correction' in plati eliminated by the use of	num resistance thermometers are [AIIMS 1998]		(a) 30°	[CBSE PMT 1992; AlIMS 1998] (b) 40°
	(a) Cells	(b) Electrodes		(c) 60°	(d) 80°
	(c) Compensating leads	(d) None of the above	22.	At what temperature the	centigrade (Celsius) and Fahrenheit,
13.	The absolute zero is the temp	erature at which		readings are the same	
					[PDMT 1007 00 2002 PUIL 1007 MNIP 1002
		[AIIMS 1998]			[KPMT 1997, 99, 2003; BHU 1997; MINK 1992;
	(a) Water freezes	[A11MS 1998]		DPMT	[RFMT 1997; 99, 2003; BHU 1997; MIR 1992; 1998; CPMT 1995; UPSEAT 1999; KCET 2000]
	<ul><li>(a) Water freezes</li><li>(b) All substances exist in so</li></ul>	[AIIMS 1998] lid state		<b>DPMT</b> (a) - 40°	(b) + 40°
	<ul><li>(a) Water freezes</li><li>(b) All substances exist in so</li><li>(c) Molecular motion ceases</li></ul>	[AIIMS 1998] lid state		DPMT (a) - 40° (c) 36.6°	(b) + 40° (d) - 37°
	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> </ul>	[AIIMS 1998] lid state	23.	DPMT (a) – 40° (c) 36.6° Standardisation of thermom	$ \begin{array}{l} \mbox{(hm 1997, 99, 2003; brid 1997; mint 1997; mint 1997; 1998; CPMT 1995; UPSEAT 1999; KCET 2000] \\ \mbox{(b)} + 40^{\circ} \\ \mbox{(d)} - 37^{\circ} \\ \mbox{eters is obtained with} \end{array} $
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperature making use of a</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998]	23.	DPMT (a) - 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer	(b) + 40° (d) - 37° eters is obtained with [CPMT 1996]
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperature making use of a</li> <li>(a) Radiation pyrometer</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998]	23.	DPMT (a) - 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer (b) Platinum resistance the	(b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therm</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer	23.	DPMT (a) - 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermon	(b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer meter
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therr</li> <li>(c) Constant volume helium</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer	23.	DPMT (a) - 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermom (d) Gas thermometer	(b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer meter
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therr</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal g</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer	23. 24.	DPMT (a) - 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermom (d) Gas thermometer The gas thermometers are	(b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer meter more sensitive than liquid thermometers
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therr</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal g</li> <li>Absolute zero (0 K) is that ter</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer nperature at which	23. 24.	DPMT (a) - 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermom (d) Gas thermometer The gas thermometers are because	(b) + 40° (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer meter more sensitive than liquid thermometers [CPMT 1993]
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therr</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal g</li> <li>Absolute zero (0 <i>K</i>) is that terr</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer nperature at which [AFMC 1993]	23. 24.	DPMT (a) - 40° (c) 36.6° Standardisation of thermometer (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermometer (d) Gas thermometer The gas thermometers are the because (a) Gases expand more that	(b) + 40° (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer meter more sensitive than liquid thermometers [CPMT 1993] an liquids
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therr</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal g</li> <li>Absolute zero (0 <i>K</i>) is that ter</li> <li>(a) Matter ceases to exist</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer mperature at which [AFMC 1993]	23. 24.	DPMT (a) - 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermom (d) Gas thermometer The gas thermometers are because (a) Gases expand more that (b) Gases are easily obtain	(b) + 40° (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer more sensitive than liquid thermometers [CPMT 1993] an liquids ed
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperature making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therred</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal generation of <i>K</i> is that terred</li> <li>(a) Matter ceases to exist</li> <li>(b) Ice melts and water freeze</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer mperature at which [AFMC 1993]	23. 24.	DPMT (a) - 40° (c) 36.6° Standardisation of thermometer (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermometer (d) Gas thermometer The gas thermometers are because (a) Gases are easily obtain (b) Gases are much lighter	(INWI 1997, 99, 2003; BHU 1997; MIKI 1992; 1998; CPMT 1995; UPSEAT 1999; KCET 2000] (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer meter more sensitive than liquid thermometers [CPMT 1993] an liquids ed
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperature making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therred</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal ge</li> <li>Absolute zero (0 <i>K</i>) is that tered</li> <li>(a) Matter ceases to exist</li> <li>(b) Ice melts and water freeze</li> <li>(c) Volume and pressure of a</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer nperature at which [AFMC 1993]	23. 24.	DPMT (a) - 40° (c) 36.6° Standardisation of thermometer (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermometer (d) Gas thermometer The gas thermometers are the because (a) Gases expand more the (b) Gases are easily obtained (c) Gases are much lighter (d) Gases do not easily char	(IVMT 1997, 99, 2003; BHU 1997; MIRT 1997; 1998; CPMT 1995; UPSEAT 1999; KCET 2000] (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer more sensitive than liquid thermometers [CPMT 1993] an liquids ed ange their states
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therr</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal g</li> <li>Absolute zero (0 <i>K</i>) is that ter</li> <li>(a) Matter ceases to exist</li> <li>(b) Ice melts and water freez</li> <li>(c) Volume and pressure of a</li> <li>(d) None of these</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer agas thermometer [AFMC 1993] res a gas becomes zero	23. 24. 25.	DPMT (a) - 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermom (d) Gas thermometer (d) Gases expand more tha because (a) Gases are easily obtain (c) Gases are much lighter (d) Gases do not easily cha because (d) Gases do not easily cha	(b) + 40° (b) + 40° (c) - 37° eters is obtained with [CPMT 1996] ermometer more sensitive than liquid thermometers [CPMT 1993] an liquids ed ange their states be used to measure temperatures upto
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperature making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therer</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal ge</li> <li>Absolute zero (0 <i>K</i>) is that tere</li> <li>(a) Matter ceases to exist</li> <li>(b) Ice melts and water freez</li> <li>(c) Volume and pressure of a</li> <li>(d) None of these</li> <li>On which of the following scale</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer nperature at which [AFMC 1993] ees a gas becomes zero ales of temperature, the temperature is	23. 24. 25.	DPMT (a) – 40° (c) 36.6° Standardisation of thermom (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermom (d) Gas thermometers are the because (a) Gases expand more tha (b) Gases are easily obtain (c) Gases are much lighter (d) Gases do not easily cha Mercury thermometers can	[CPMT 1997, 99, 2003; BHU 1997; MIRE 1997; MIRE 1997; 1998; CPMT 1995; UPSEAT 1999; KCET 2000] (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer more sensitive than liquid thermometers [CPMT 1993] an liquids ed . ange their states be used to measure temperatures upto IBSE PMT 1992, 96; BHU 1998; UPSEAT 1998]
14. 15.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therr</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal g</li> <li>Absolute zero (0 <i>K</i>) is that ter</li> <li>(a) Matter ceases to exist</li> <li>(b) Ice melts and water freez</li> <li>(c) Volume and pressure of a</li> <li>(d) None of these</li> <li>On which of the following scanever negative</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer nperature at which [AFMC 1993] ees a gas becomes zero when of temperature, the temperature is [EAMCET 1997]	23. 24. 25.	DPMT (a) - 40° (c) 36.6° Standardisation of thermometer (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermom (d) Gas thermometer (d) Gas thermometers are the because (a) Gases are easily obtain (b) Gases are easily obtain (c) Gases are much lighter (d) Gases do not easily cha Mercury thermometers can [C (a) 100° <i>C</i>	[CPMT 1997, 99, 2003; BHU 1997; MIRE 1997; MIRE 1997; 1998; CPMT 1995; UPSEAT 1999; KCET 2000] (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer more sensitive than liquid thermometers [CPMT 1993] an liquids ed . ange their states be used to measure temperatures upto CBSE PMT 1992, 96; BHU 1998; UPSEAT 1998] (b) 212°C
14. 15.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperatur making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therr</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal g</li> <li>Absolute zero (0 <i>K</i>) is that ter</li> <li>(a) Matter ceases to exist</li> <li>(b) Ice melts and water freez</li> <li>(c) Volume and pressure of a</li> <li>(d) None of these</li> <li>On which of the following scanever negative</li> <li>(a) Celsius</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer gas thermometer agas thermometer mperature at which [AFMC 1993] ees a gas becomes zero whes of temperature, the temperature is [EAMCET 1997] (b) Fahrenheit	23. 24. 25.	DPMT (a) $-40^{\circ}$ (c) $36.6^{\circ}$ Standardisation of thermometer (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermon (d) Gas thermometer (d) Gas thermometers are the because (a) Gases expand more that (b) Gases are easily obtain (c) Gases are much lighter (d) Gases do not easily chat Mercury thermometers can [C (a) $100^{\circ}C$ (c) $360^{\circ}C$	[CPMT 1997, 99, 2003; BHU 1997; MIRE 1997; MIRE 1997; 1998; CPMT 1995; UPSEAT 1999; KCET 2000] (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer more sensitive than liquid thermometers [CPMT 1993] an liquids ed . ange their states be used to measure temperatures upto CBSE PMT 1992, 96; BHU 1998; UPSEAT 1998] (b) 212°C (d) 500°C
14.	<ul> <li>(a) Water freezes</li> <li>(b) All substances exist in so</li> <li>(c) Molecular motion ceases</li> <li>(d) None of the above</li> <li>Absolute scale of temperature making use of a</li> <li>(a) Radiation pyrometer</li> <li>(b) Platinum resistance therer</li> <li>(c) Constant volume helium</li> <li>(d) Constant pressure ideal ge</li> <li>Absolute zero (0 <i>K</i>) is that tere</li> <li>(a) Matter ceases to exist</li> <li>(b) Ice melts and water freeze</li> <li>(c) Volume and pressure of a</li> <li>(d) None of these</li> <li>On which of the following scanever negative</li> <li>(a) Celsius</li> <li>(c) Reaumur</li> </ul>	[AIIMS 1998] lid state e is reproduced in the laboratory by [SCRA 1998] nometer gas thermometer agas thermometer mperature at which [AFMC 1993] ees a gas becomes zero whes of temperature, the temperature is [EAMCET 1997] (b) Fahrenheit (d) Kelvin	23. 24. 25.	DPMT (a) $-40^{\circ}$ (c) $36.6^{\circ}$ Standardisation of thermometer (a) Jolly's thermometer (b) Platinum resistance the (c) Thermocouple thermometer (d) Gas thermometer The gas thermometers are the because (a) Gases expand more that (b) Gases are easily obtain (c) Gases are much lighter (d) Gases do not easily chat Mercury thermometers can [C (a) $100^{\circ}C$ (c) $360^{\circ}C$ A constant volume gas th	[CPMT 1997, 99, 2003; BHU 1997; MIRE 1997; 1998; CPMT 1995; UPSEAT 1999; KCET 2000] (b) + 40° (d) - 37° eters is obtained with [CPMT 1996] ermometer meter more sensitive than liquid thermometers [CPMT 1993] an liquids ed . ange their states be used to measure temperatures upto ESE PMT 1992, 96; BHU 1998; UPSEAT 1998] (b) 212°C (d) 500°C mermometer shows pressure reading of

- Steam at  $100^{\circ}C$  is passed into 1.1 kg of water contained in a calorimeter of water equivalent 0.02 kg at 15°C till the temperature of the calorimeter and its contents rises to 80°C. The mass of the steam condensed in kg is
  - (a) 0.130 (b) 0.065
  - (c) 0.260 (d) 0.135
- 2 kg of ice at  $-20^{\circ}C$  is mixed with 5 kg of water at  $20^{\circ}C$  in an insulating vessel having a negligible heat capacity. Calculate the final mass of water remaining in the container. It is given that the specific
  - the latent heat of fusion of ice is 80 kcal/kg [IIT-JEE (Screening) 2003] (b) 6 kg (a) 7 kg
  - (d) 2 kg (c) 4 kg

Water of volume 2 *litre* in a container is heated with a coil of 1 kW

at  $27 \,^{\circ}C$ . The lid of the container is open and energy dissipates at rate of 160 J/s. In how much time temperature will rise from

heats of water and ice are 1 kcal/kg per °C and 0.5 kcal/kg/°C while

 $27 \,^{\circ}C$  to  $77 \,^{\circ}C$  [Given specific heat of water is  $4.2 \, kJ \, / \, kg$ ]

- (a) 8 min 20 s (b) 6 min 2 s
- (d) 14 min (c) 7 min
- A lead bullet at  $27^{\circ}C$  just melts when stopped by an obstacle. 17. Assuming that 25% of heat is absorbed by the obstacle, then the velocity of the bullet at the time of striking (M.P. of lead = 327° C, specific heat of lead = 0.03 callgm<sup>e</sup>C, latent heat of fusion of lead = 6 [IIT 1981]

(b) 1230 m/sec

- (a) 410 *m*/sec
- (c) 307.5 *m*/sec (d) None of the above
- If two balls of same metal weighing 5 gm and 10 gm strike with a 18. target with the same velocity. The heat energy so developed is used for raising their temperature alone, then the temperature will be higher
  - (a) For bigger ball
  - (b) For smaller ball
  - (c) Equal for both the balls
  - (d) None is correct from the above three
- The temperature of equal masses of three different liquids A, B and C are  $12^{\circ}C$ ,  $19^{\circ}C$  and  $28^{\circ}C$  respectively. The temperature when A19. and B are mixed is 16°C and when B and C are mixed is 23°C. The temperature when A and C are mixed is

- (a)  $18.2^{\circ}C$  (b)  $22^{\circ}C$
- (c)  $20.2^{\circ}C$  (d)  $25.2^{\circ}C$
- **20.** In an industrial process 10 kg of water per hour is to be heated from  $20^{\circ}C$  to  $80^{\circ}C$ . To do this steam at  $150^{\circ}C$  is passed from a boiler into a copper coil immersed in water. The steam condenses in the coil and is returned to the boiler as water at  $90^{\circ}C$ . how many kg of steam is required per hour.

(Specific heat of steam = 1 *calorie* per *gm<sup>c</sup>C*, Latent heat of vaporisation = 540 *cal*/*gm*)

- (a) 1 gm (b) 1 kg
- (c) 10 gm (d) 10 kg
- **21.** In a vertical U-tube containing a liquid, the two arms are maintained at different temperatures  $t_1$  and  $t_2$ . The liquid columns in the two arms have heights  $l_1$  and  $l_2$  respectively. The coefficient of volume expansion of the liquid is equal to

**22.** The coefficient of linear expansion of crystal in one direction is  $\alpha_1$  and that in every direction perpendicular to it is  $\alpha_2$ . The coefficient of cubical expansion is

- (a)  $\alpha_1 + \alpha_2$  (b)  $2\alpha_1 + \alpha_2$
- (c)  $\alpha_1 + 2\alpha_2$  (d) None of these
- **23.** Three rods of equal length *I* are joined to form an equilateral triangle *PQR*. *O* is the mid point of *PQ*. Distance *OR* remains same for small change in temperature. Coefficient of linear expansion for *PR* and *RQ* is same *i.e.*  $\alpha_2$  but that for *PQ* is  $\alpha_1$ . Then
  - (a)  $\alpha_2 = 3\alpha_1$
  - (b)  $\alpha_2 = 4\alpha_1$
  - (c)  $\alpha_1 = 3\alpha_2$

(d)  $\alpha_1 = 4\alpha_2$ 

- **24.** A one *litre* glass flask contains some mercu $\Theta$ . It is found that at different temperatures the volume of air inside the flak remains the same. What is the volume of mercury in this flask if coefficient of linear expansion of glass is  $9 \times 10^{-6}C$  while of volume expansion of mercury is  $1.8 \times 10^{-6}C$ 
  - (a) 50 *cc* (b) 100 *cc*
  - (c) 150 *cc* (d) 200 *cc*
- **25.** 10 gm of ice at  $-20^{\circ}C$  is dropped into a calorimeter containing 10 gm of water at  $10^{\circ}C$ ; the specific heat of water is twice that of ice. When equilibrium is reached, the calorimeter will contain
  - (a) 20 gm of water

- (b) 20 *gm* of ice
- (c) 10 gm ice and 10 gm water
- (d) 5 gm ice and 15 gm water
- **26.** A rod of length 20 cm is made of metal. It expands by 0.075cm when its temperature is raised from 0°C to 100°C. Another rod of a different metal *B* having the same length expands by 0.045 cm for the same change in temperature. A third rod of the same length is composed of two parts, one of metal *A* and the other of metal *B*. This rod expands by 0.060 cm for the same change in temperature. The portion made of metal *A* has the length
  - (a) 20 *cm* (b) 10 *cm*
  - (c) 15 *cm* (d) 18 *cm*
- 27. Steam is passed into 22 gm of water at 20°C. The mass of water that will be present when the water acquires a temperature of 90°C (Latent heat of steam is 540 callgm) is

[SCRA 1994]

(a) 24.8 gm
(b) 24 gm
(c) 36.6 gm
(d) 30 gm

The graph *AB* shown in figure is a plot of temperature of a body in degree celsius and degree Fahrenheit. Then

- (a) Slope of line AB is 9/5 (b) Slope of line AB is 5/9
- (c) Slope of line AB is 1/9 (d) Slope of line AB is 3/9
- 2.

l.

The graph shows the variation of temperature (7) of one *kilogram* of a material with the heat (H) supplied to it. At O, the substance is in the solid state. From the graph, we can conclude that

- (a)  $T_2$  is the melting point of the solid
- (b) BC represents the change of state from solid to liquid
- (c)  $(H_2 H_1)$  represents the latent heat of fusion of the substance
- (d)  $(H_3 H_1)$  represents the latent heat of vaporization of the liquid

**4.** The portion *AB* of the indicator diagram representing the state of matter denotes

- (b) Gaseous state of matter
- (c) Change from liquid to gaseous state
- (d) Change from gaseous state to liquid state
- **5.** The figure given below shows the cooling curve of pure wax material after heating. It cools from *A* to *B* and solidifies along *BD*. If *L* and *C* are respective values of latent heat and the specific heat of the liquid wax, the ratio L/C is

A solid substance is at 30°C. To this substance heat energy is supplied at a constant rate. Then temperature versus time graph is as shown in the figure. The substance is in liquid state for the portion (of the graph) [RPET 1990, 94]

**7.** The variation of density of water with temperature is represented by the

- If a graph is plotted taking the temperature in Fahrenheit along  $\gamma$ axis and the corresponding temperature in Celsius along the  $\chi$ -axis, it will be a straight line [AIIMS 1997]
  - (a) Having a +ve intercept on Y-axis
  - (b) Having a +ve intercept on X-axis
  - (c) Passing through the origin
- (d) Having a ve intercepts on both the axis

Heat is supplied to a certain hdmogenous sample of matter, at a uniform rate. Its temperature is plotted against time, as shown. Which of the following conclusions can be drawn

- (a) Its specific heat capacity is greater into the solid state than in the liquid state
- $(b) \;\;$  Its specific heat capacity is greater in the liquid state than in the solid state
- $(c) \;\;$  Its latent heat of vaporization is greater than its latent heat of fusion
- (d) Its latent heat of vaporization is smaller than its latent of fusion
- A student takes 50gm wax (specific heat = 0.6  $kcal/kg^{\circ}C$ ) and heats it till it boils. The graph between temperature and time is as follows. Heat supplied to the wax per minute and boiling point are respectively [BHU 1994]

Time

# Answers and Solutions

#### Thermometry

(d) 
$$T = 273.15 + t^{\circ}C \Rightarrow 0 = 273.15 + t^{\circ}C$$
  
 $\Rightarrow t = -273.15^{\circ}C$ 

**2.** (b) 
$$\frac{C}{5} = \frac{F - 32}{9} \Rightarrow \frac{-183}{5} = \frac{F - 32}{9} \Rightarrow F = -297^{\circ}F$$

**3.** (a) 
$$\frac{F-32}{9} = \frac{K-273}{5} \Rightarrow \frac{F-32}{9} = \frac{95-273}{5} \Rightarrow F = -288^{\circ}F$$

(c) Temperature change in Celsius scale = Temperature change in Kelvin scale = 27 K

(b) Change in resistance  $3.70 - 2.71 = 0.99 \Omega$  corresponds to interval of temperature  $90^{\circ}C$ .

So change in resistance  $3.26 - 2.71 = 0.55 \Omega$  Corresponds to change in temperature

$$=\frac{90}{0.99} \times 0.55 = 50^{\circ}C$$

- (d)  $-200^{\circ}C$  to  $600^{\circ}C$  can be measured by platinum resistance thermometer.
- (c) Pyrometer can measure temperature from 800°C to 6000°C.
   Hence temperature of sun is measured with pyrometer.

(a) 
$$v^2 \propto T$$

7.

8.

9. (b) Thermoelectric thermometer is based on Seeback Effect.

**10.** (b) Maximum density of water is at  $4^{\circ}C$ 

Also 
$$\frac{C}{5} = \frac{F-32}{9} \Rightarrow \frac{4}{5} = \frac{F-32}{9} \Rightarrow F = 39.2^{\circ}F$$

**11.** (c) Production and measurement of temperature close to 0 K is done in cryogenics

**13.** (c) At absolute zero (*i.e.* 0 K)  $v_{-}$  becomes zero.

14. (c)

15.

(c) We know that  $P = P_0(1 + \gamma t)$  and  $V = V_0(1 + \gamma t)$ 

and  $\gamma = (1/273)/{}^{\circ}C$  for  $t = -273{}^{\circ}C$  , we have P = 0 and V = 0

Hence, at absolute zero, the volume and pressure of the gas become zero.

**16.** (d) Zero kelvin  $= -273^{\circ}C$  (absolute temperature). As no matter can attain this temperature, hence temperature can never be negative on Kelvin scale.

17. (b) 
$$\frac{C}{5} = \frac{F - 32}{9} \Rightarrow \frac{25}{5} = \frac{F - 32}{9} \Rightarrow F = 77^{\circ}F$$

- (c) Thermoelectric thermometer is used for finding rapidly varying temperature.
- 19. (c) Due to evaporation cooling is caused which lowers the temperature of bulb wrapped in wet hanky.

**20.** (c) 
$$\frac{F-32}{9} = \frac{K-273}{5} \Rightarrow \frac{x-32}{9} = \frac{x-273}{5} \Rightarrow x = 574.25$$

**21.** (c) 
$$\frac{C}{5} = \frac{F-32}{9} \Rightarrow \frac{C}{5} = \frac{(140-32)}{9} \Rightarrow C = 60^{\circ}$$

**22.** (a) 
$$\frac{C}{5} = \frac{F - 32}{9} \Rightarrow \frac{t}{5} = \frac{t - 32}{9} \Rightarrow t = -40^{\circ}$$

- **23.** (d) Standardisation of thermometers is done with gas thermometer.
- **24.** (a) For gases  $\gamma$  is more.
- (c) The boiling point of mercury is 400°*C*. Therefore, the mercury thermometer can be used to measure the temperature upto 360°*C*.

**26.** (a) 
$$t = \frac{(P_t - P_0)}{(P_{100} - P_0)} \times 100^{\circ}C = \frac{(60 - 50)}{(90 - 50)} \times 100 = 25^{\circ}C$$

- 27. (b) By filling nitrogen gas at high pressure, the boiling point of mercury is increased which extend the range upto 500°C.
- **28.** (a) Pyrometer is used to measure very high temperature.

**29.** (c) 
$$\frac{F-32}{9} = \frac{K-273}{5} \Rightarrow \frac{F-32}{9} = \frac{0-273}{5}$$
  
 $\Rightarrow F = -459.4^{\circ}F \approx -460^{\circ}F$ 

**30.** (c) Initial volume  $V_1 = 47.5$  units

Temperature of ice cold water  $T_1 = 0^{\circ}C = 273 K$ 

Final volume of 
$$V_2 = 67$$
 units

Applying Charle's law, we have  $\frac{V_1}{T_1} = \frac{V_2}{T_2}$ 

(where temperature  $T_2$  is the boiling point)

or 
$$T_2 = \frac{V_2}{V_1} \times T_1 = \frac{67 \times 273}{47.5} = 385 K = 112^{\circ}C$$

- **31.** (a) Temperature on any scale can be converted into other scale by  $\frac{x - LFP}{UFP - LFP} = \text{Constant for all scales } \frac{x - 20}{150 - 20} = \frac{60}{100} \Rightarrow$   $x = 98^{\circ}C$
- **32.** (d)  $\frac{C}{5} = \frac{F 32}{9} \Rightarrow \frac{C}{5} = \frac{140 32}{9} \Rightarrow C = 60^{\circ}C$
- **33.** (a) Rapidly changing temperature is measured by thermocouple thermometers.
- **34.** (d) Difference of  $100^{\circ}C =$  difference of  $180^{\circ}F$

:. Difference of 
$$30^{\circ} = \frac{180}{100} \times 30 = 54^{\circ}$$

**35.** (a)

.

#### Thermal Expansion

1. (c) When a copper ball is heated, it's size increases. As Volume  $\infty$ (radius) and Area  $\infty$  ((radius), so percentage increase will be largest in it's volume. Density will decrease with rise in temperature.

2. (a) 
$$\frac{h_1}{h_2} = \frac{\rho_1}{\rho_2} = \frac{(1+\gamma\theta_1)}{(1+\gamma\theta_2)} \qquad \left[ \because \rho = \frac{\rho_0}{(1+\gamma\theta)} \right]$$
$$\Rightarrow \frac{50}{60} = \frac{1+\gamma\times50}{1+\gamma\times100} \Rightarrow \gamma = 0.005/°C$$

**3.** (b)  $\gamma_r = \gamma_a + \gamma_v$ ; where  $\gamma_r$  = coefficient of real expansion,

 $\gamma_a={\rm coefficient}$  of apparent expansion and  $~\gamma_\nu~={\rm coefficient}$  of expansion of vessel.

For copper  $\gamma_r = C + 3 \alpha_{Cu} = C + 3A$ For silver  $\gamma_r = S + 3 \alpha_{A_P}$ 

$$\Rightarrow C + 3A = S + 3\alpha_{Ag} \Rightarrow \alpha_{Ag} = \frac{C - S + 3A}{3}$$

4. (d) Fractional change in period

$$\frac{\Delta T}{T} = \frac{1}{2} \alpha \Delta \theta = \frac{1}{2} \times 2 \times 10^{-6} \times 10 = 10^{-5}$$
  
% change =  $\frac{\Delta T}{T} \times 100 = 10^{-5} \times 100 = 10^{-3}$  %

5. (c) 
$$L = L_0(1 + \alpha \Delta \theta) \Rightarrow \frac{L_1}{L_2} = \frac{1 + \alpha (\Delta \theta)_1}{1 + \alpha (\Delta \theta)_2}$$
  
 $\Rightarrow \frac{10}{L_2} = \frac{1 + 11 \times 10^{-6} \times 20}{1 + 11 \times 10^{-6} \times 19} \Rightarrow L_2 = 9.99989$   
 $\Rightarrow$  Length is shorten by  
 $10 - 9.99989 = 0.00011 = 11 \times 10^{-5} cm$ 

- **6.** (c) Stress =  $Y \alpha \Delta \theta$ ; hence it is independent of length.
- (c) Solids, liquids and gases all expand on being heated as result density (= mass/volume) decreases.
- (c) As coefficient of cubical expansion of liquid equals coefficient of cubical expansion of vessel, the level of liquid will not change on heating.
- 9. (b) Loss in time per second  $\frac{\Delta T}{T} = \frac{1}{2} \alpha \Delta \theta = \frac{1}{2} \alpha (t t)$

 $\Rightarrow$  loss in time per day

$$\Delta t = \left(\frac{1}{2}\alpha t\right)t = \frac{1}{2}\alpha t \times (24 \times 60 \times 60) = \frac{1}{2}\alpha t \times 86400$$

(c) A bimetallic strip on being heated bends in the form of an arc with more expandable metal (A) outside (as shown) correct.

11.

1

- (a) When the ball is heated, α<sub>a</sub> a a generation of ball and cavity both occurs, hence volume of cavity increases.
- 12. (b) In summer alcohol expands, density decreases, so 1 litre of alcohol will weigh less in summer than in winter.
- (b) Similar to previous question, benzene contracts in winter. So 5 litre of benzene will weigh more in winter than in summer.
- **14.** (d) Water has maximum density at  $4^{\circ}C$ .
- (a) Since coefficient of expansion of steel is greater than that of bronze. Hence with small increase in it's temperature the hole expand sufficiently.

**6.** (d) 
$$A \propto L^2 \Rightarrow \frac{\Delta A}{A} = 2 \cdot \frac{\Delta L}{L} \Rightarrow \frac{\Delta A}{A} = 2 \times 2 = 4\%$$
.

**17.** (d) 
$$\frac{V_1}{V_2} = \frac{1 + \gamma t_1}{1 + \gamma t_2} \Rightarrow \frac{100}{125} = \frac{1 + \gamma \times 20}{1 + \gamma \times 100} \Rightarrow \gamma = 0.0033/°C$$

**18.** (d) 
$$\alpha = \frac{\beta}{2} = \frac{2 \times 10^{-5}}{2} = 10^{-5} / {}^{\circ}C$$

**19.** (d) Coefficient of volume expansion

$$\gamma = \frac{\Delta \rho}{\rho \cdot \Delta T} = \frac{(\rho_1 - \rho_2)}{\rho \cdot (\Delta \theta)} = \frac{(10 - 9.7)}{10 \times (100 - 0)} = 3 \times 10^{-4}$$

Hence, coefficient of linear expansion

$$\alpha = \frac{\gamma}{3} = 10^{-4} / ^{\circ}C$$

**20.** (a) 
$$\rho = \rho_0 (1 - \gamma \Delta \theta) = 13.6[1 - 0.18 \times 10^{-3} (473 - 273)]$$
  
= 13.6[1 - 0.036] = 13.11 gm/cc.

**21.** (b) As we know  $\gamma_{real} = \gamma_{app.} + \gamma_{vessel}$ 

$$\Rightarrow \gamma_{\rm app.} = \gamma_{\rm glycerine} - \gamma_{\rm glass}$$

$$= 0.000597 - 0.000027 = 0.00057 / ^{\circ}C$$

22. (c) Water has maximum density at 4°C, so if the water is heated above 4°C or cooled below 4°C density decreases *i.e.* volume increases. In other words, it expands so it overflows in both the cases.
23. (a) 0°C 4°C Temp.

10.

1

13.

14.

15.

$$\gamma = \frac{\Delta V}{V.\Delta T} = \frac{0.24}{100 \times 40} = 6 \times 10^{-5} / {}^{\circ}C$$
$$\Rightarrow \alpha = \frac{\gamma}{3} = 2 \times 10^{-5} / {}^{\circ}C$$
(a) As  $\alpha = \frac{\beta}{2} = \frac{\gamma}{3} \Rightarrow \alpha : \beta : \gamma = 1 : 2 : 3$ 

Mass expelled (a)  $\gamma_{app.} = \frac{1}{Mass remained \times \Delta T}$ 

24.

25.

$$=\frac{x/100}{x\times80}=\frac{1}{8000}=1.25\times10^{-4}/°C$$

- (b) In anomalous expansion, water contracts on heating and 26. expands on cooling in the range 0°C to 4°C. Therefore water pipes sometimes burst, in cold countries.
- On heating the system; x, r, d all increases, since the expansion 27. (c) of isotropic solids is similar to true photographic enlargement.

28. (d) 
$$\alpha = \frac{\Delta L}{L_0 \times \Delta \theta} = \frac{0.01}{5 \times 100} = 2 \times 10^{-5} / {^\circ}C$$

29. (a) 
$$\alpha = \frac{\Delta L}{L_0(\Delta \theta)} = \frac{0.19}{100(100-0)} = 1.9 \times 10^{-5} / {^\circ}C$$

Now  $\gamma = 3\alpha = 3 \times 1.9 \times 10^{\circ}/^{\circ}C = 5.7 \times 10^{\circ}/^{\circ}C$ 

Since, the coefficient of linear expansion of brass is greater 30. (d) than that of steel. On cooling, the brass contracts more, so, it get loosened.

**31.** (b) Increase in length 
$$\Delta L = L \alpha \Delta \theta$$

$$= 10 \times 10 \times 10^{\circ} \times (100 - 0) = 10^{\circ} m = 1 cm$$

**32.** (a) 
$$\alpha = \frac{\Delta L}{L_0 \Delta \theta} = \frac{(1 - 0.9997)}{0.9997 \times 12 \times 10^{-6}} = 25^{\circ}C$$

(c) The densest layer of water will be at bottom. The density of 33. water is maximum at 4°C. So the temperature of bottom of lake will be 4°C.

**34.** (c) Given 
$$\Delta l_1 = \Delta l_2$$
 or  $l_1 \alpha_a t = l_2 \alpha_s t$ 

$$\frac{l_1}{l_2} = \frac{\alpha_s}{\alpha_a} \quad \text{or} \quad \frac{l_1}{l_1 + l_2} = \frac{\alpha_s}{\alpha_a + \alpha_s}$$

#### Calorimetry

- 1. (b) In vapor to liquid phase transition, heat liberates.
- 2. (b) Pressure inside the mines is greater than that of normal. Pressure. Also we know that boiling point increases with increase in pressure.

**3.** (c) 
$$Q = m.c.\Delta\theta \Rightarrow c = \frac{Q}{m.\Delta\theta}$$
; when  $\Delta\theta = 0 \Rightarrow c = \infty$ 

- (c) Mass and volume of the gas will remain same, so density will 4 also remain same.
- (d) 5.

(a)

8.

- (a) The latent heat of vaporization is always greater than latent 6. heat of fusion because in liquid to vapour phase change there is a large increase in volume. Hence more heat is required as compared to solid to liquid phase change.
- 7. When state is not changing  $\Delta Q = mc\Delta \theta$ . (c)

Heat taken by ice to melt at 
$$0^{\circ}C$$
 is

 $Q_1 = mL = 540 \times 80 = 43200 \, cal$ 

Heat given by water to cool upto  $0^{\circ}C$  is

$$Q_2 = ms\Delta\theta = 540 \times 1 \times (80 - 0) = 43200 \, cal$$

Hence heat given by water is just sufficient to melt the whole ice and final temperature of mixture is  $0^{\circ}C$ .

Short trick : For these type of frequently asked questions you can remember the following formula

$$\theta_{\rm mix} = \frac{m_W \theta_W - \frac{m_i L_i}{c_W}}{m_i + m_W}$$
 (See theory for more details)  
$$\theta_W - \frac{L_i}{c_W} = 80 - \frac{80}{10}$$

\_

If 
$$m_W = m_i$$
 then  $\theta_{mix} = \frac{c_W}{2} = \frac{1}{2} = 0^\circ C$ 

(d) Due to large specific heat of water, it releases large heat with 9. very small temperature change.

(a) 
$$Q = m.c.\Delta\theta = 5 \times (1000 \times 4.2) \times (100 - 20)$$

$$=1680 \times 10^{3} J = 1680 kJ$$

(b) Melting point of ice decreases with increase in pressure (as ice 11. expands on solidification).

**2.** (c) Conversion of ice 
$$(0^{\circ}C)$$
 into steam  $(100^{\circ}C)$  is as follows

$$(Q_1 = mL_i)$$
Water at 0°C
$$(Q_2 = mc_{\mu}\Delta\theta)$$

$$(Q_3 = mL_i)$$
Water at 100°C
Water at 100°C

Heat required in the given process =  $Q_1 + Q_2 + Q_3$ 

$$= 1 \times 80 + 1 \times 1 \times (100 - 0) + 1 \times 536 = 716 \, cal$$

(a) If *m gm* ice melts then Heat lost = Heat gain 00 1 (20 0) 00

$$80 \times 1 \times (30 - 0) = m \times 80 \implies m = 30 \text{ gm}$$

(c) At boiling point saturation vapour pressure becomes equal to atmospheric pressure. Therefore, at 100°C for water. S.V.P. = 760 mm of Hg (atm pressure).

(b) Thermal capacity = Mass × Specific heat Due to same material both spheres will have same specific heat. Also mass = Volume (V) × Density ( $\rho$ )

∴ Ratio of thermal capacity

$$=\frac{m_1}{m_2}=\frac{V_1\rho}{V_2\rho}=\frac{\frac{4}{3}\pi r_1^3}{\frac{4}{3}\pi r_2^3}=\left(\frac{r_1}{r_2}\right)^3=\left(\frac{1}{2}\right)^3=1:8$$

16. (a) Ice  $(-10^{\circ}C)$  converts into steam as follows

( $c_{r}$  = Specific heat of ice,  $c_{r}$  = Specific heat of water)

$$(Q_{1} = mc\Delta\theta)$$

$$(Q_{1} = mc\Delta\theta)$$

$$(Q_{2} = mL_{d})$$

$$(Q_{3} = mc_{H}\Delta\theta)$$

$$(Q_{3} = mc_{H}\Delta\theta)$$

$$(Q_{4} = mL_{v})$$

$$(Q_{4} = mL$$

Total heat required  $\mathcal{Q} \stackrel{\text{tean}}{=} \mathcal{Q}_1^{\text{at}} + \mathcal{Q}_2^{\text{c}} + \mathcal{Q}_3 + \mathcal{Q}_4$ 

$$\Rightarrow Q = 1 \times 0.5(10) + 1 \times 80 + 1 \times 1 \times (100 - 0) + 1 \times 540$$

$$=725 \, cal$$

Hence work done  $W = JQ = 4.2 \times 725 = 3045 J$ 

- 17. (b) When water is cooled at  $0^{\circ}C$  to form ice then 80 *calorie/gm* (latent heat) energy is released. Because potential energy of the molecules decreases. Mass will remain constant in the process of freezing of water.
- 18. (a) Steam at 100°C contains extra 540 calorie/gm energy as compare to water at 100°C. So it's more dangerous to burn with steam then water.
- 19. (a) Same amount of heat is supplied to copper and water so  $m_c c_c \Delta \theta_c = m_W c_W \Delta \theta_W$

$$\Rightarrow \Delta \theta_W = \frac{m_c c_c (\Delta \theta)_c}{m_W c_W} = \frac{50 \times 10^{-3} \times 420 \times 10}{10 \times 10^{-3} \times 4200} = 5^{\circ}C$$

**20.** (c) Temperature of mixture 
$$\theta_{mix} = \frac{\theta_A c_A + \theta_B c_B}{c_A + c_B}$$

$$\Rightarrow 28 = \frac{32 \times c_A + 24 \times c_B}{c_A + c_B}$$
$$\Rightarrow 28 c_A + 28 c_B = 32 c_A + 24 c_B \Rightarrow \frac{c_A}{c_B} = \frac{1}{1}$$

(b) Heat lost by hot water = Heat gained by cold water in beaker + 21. Heat absorbed by beaker

$$\Rightarrow 440(92 - \theta) = 200 \times (\theta - 20) + 20 \times (\theta - 20)$$
$$\Rightarrow \theta = 68^{\circ}C$$

- (b)  $Q = m.c.\Delta\theta$ ; if  $\Delta\theta = 1 K$ then Q = mc = Thermal22. capacity.
- Latent heat is independent of configuration. Ordered energy 23. (a) spent in stretching the spring will not contribute to heat which is disordered kinetic energy of molecules of substance.
- Temperature of mixture 24. (d)

$$\theta_{mix} = \frac{m_1 c_1 \theta_1 + m_2 c_2 \theta_2}{m_1 c_1 + m_2 c_2} = \frac{m \times c \times 2T + \frac{m}{2} (2c)T}{m.c + \frac{m}{2} (2c)} = \frac{3}{2}T$$

25. (a)

26. (a) 
$$\theta_{mix} = \frac{\theta_W - \frac{L_i}{c_W}}{2} = \frac{100 - \frac{80}{1}}{2} = 10^{\circ}C$$

27. (b) When pressure decreases, boiling point also decreases.

- 28. Boiling occurs when the vapour pressure of liquid becomes (a) equal to the atmospheric pressure. At the surface of moon, atmospheric pressure is zero, hence boiling point decreases and water begins to boil at 30°C.
- (d) Thermal capacity  $= mc = 40 \times 0.2 = 8 \ cal/^{\circ}C$ . 29.

**30.** (b) 
$$Q = m.c.\Delta\theta \Rightarrow c = \frac{Q}{m.\Delta\theta}$$
  
In temperature measurement scale  $\Delta\theta^{\circ}F > \Delta\theta^{\circ}C$  so  $(c)_{\circ_{F}} < (c)_{\circ_{C}}$ .

- (a) Increasing pressure lowers melting point of ice. 31.
- 32. (b) Work done changes into heat energy, when the temperature of palm becomes above the atmosphere so it starts losing heat to the surroundings.

**33.** (b) Firstly the temperature of bullet rises up to melting point, then it melts. Hence according to 
$$W = JQ$$
.

$$\Rightarrow \frac{1}{2}mv^{2} = J.[m.c.\Delta\theta + mL] = J[m S (475 - 25) + mL]$$
$$\Rightarrow mS(475 - 25) + mL = \frac{mv^{2}}{2J}$$
(a) As  $W = JQ \Rightarrow \frac{1}{2}(mgh) = J \times mc\Delta\theta \Rightarrow \Delta\theta = \frac{gh}{2Jc}$ 

$$\Delta\theta = \frac{9.8 \times 84}{2 \times 4.2 \times 1000} = 0.098^{\circ}C$$

$$(\because c_{\text{water}} = 1000 \frac{cal}{kg \times °C})$$

Short trick : Remember the value of  $\frac{g}{Jc_W}=0.0023$  , here

$$\Delta\theta = \frac{1}{2} \times (0.0023)h = \frac{1}{2} \times 0.0023 \times 84 = 0.098^{\circ}C$$

**35.** (a) 
$$W = JQ \implies mgh = J \times Q$$

$$\Rightarrow Q = \frac{mgh}{J} = \frac{5 \times 9.8 \times 30}{4.2} = 350 \, cal$$

(b)  $W = JQ = 4.18 \times 400 = 1672$  joule 36.

**37.** (c) Energy supplied 
$$= 0.93 \times 3600$$
 *joules*= 3348 *joules*  
Heat required to melt 10 *gms* of ice

 $=10 \times 80 \times 4.18 = 3344$  joules

Hence block of ice just melts.

$$\Rightarrow 60 \times 9.8 \times h = 4.2 \times \left(10^5 \times \frac{28}{100}\right) \Rightarrow h = 200 \, m$$

(a) When water falls from a height, loss of potential energy causes 39. rise in temperature.

**40.** (a) 
$$W = JQ \implies mg \ h = J(m.c.\Delta\theta)$$

$$\Rightarrow \Delta\theta = \frac{gh}{Jc} = 0.0023 h = 0.0023 \times 84 = 0.196^{\circ}C$$

(a) Suppose m' kg ice melts out of m kg then by using 41.

 $W = JQ \implies mgh = J(m'L)$ . Hence fraction of ice melts

$$=\frac{m'}{m}=\frac{gh}{JL}=\frac{9.8\times1000}{4.18\times80}=\frac{1}{33}$$

**42.** (b) 
$$J = \frac{W}{Q} = \frac{Joule}{cal}$$

2

**43.** (d) 
$$W = JQ \implies (2m)gh = J \times m'c\Delta\theta$$

$$\Rightarrow 2 \times 5 \times 10 \times 10 = 4.2(2 \times 1000 \times \Delta\theta)$$

$$\Rightarrow \Delta \theta = 0.1190^{\circ}C = 0.12^{\circ}C$$

**44.** (b) 
$$W = JQ \Rightarrow \frac{1}{2} \left(\frac{1}{2}mV^2\right) = J \times mS\Delta\theta \Rightarrow \Delta\theta = \frac{V^2}{4JS}$$

38  $W = JQ \implies mgh = JQ$ 

34.

.

**46.** (c) 
$$\Delta \theta = 0.0023 h = 0.0023 \times 210 = 0.483^{\circ}C \approx 0.49^{\circ}C$$

**47.** (a) According to energy conservation, change in kinetic energy appears in the form of heat (thermal energy).

$$\Rightarrow i.e. \text{ Thermal energy} = \frac{1}{2}m(v_1^2 - v_2^2) \qquad \left[ \because W_{\text{(Joule)}} = Q_{\text{(Joule)}} \right]$$
$$= \frac{1}{2}(100 \times 10^{-3})(10^2 - 5^2) = 3.75 J$$

**48.** (b) Work done to raise the temperature of 100 gm water through  $10^{\circ}C$  is

$$W = JQ = 4.2 \times (100 \times 10^{-3} \times 1000 \times 10) = 4200 J$$

- **49.** (b) Among all the option, latent heat of steam is highest.
- **50.** (a)  $\Delta \theta = 0.0023 h = 0.0023 \times 100 = 0.23^{\circ}C$
- **51.** (c) Since specific heat of lead is given in *Joules*, hence use W = Q instead of W = JQ.

$$\Rightarrow \frac{1}{2} \times \left(\frac{1}{2} m v^2\right) = m.c.\Delta\theta \Rightarrow \Delta\theta = \frac{v^2}{4c} = \frac{(300)^2}{4 \times 150} = 150^{\circ}C.$$

- **52.** (d) At boiling point, vapour pressure becomes equal to the external pressure.
- 53. (c) When pressure increases boiling point also increases.
- **54.** (b) Calorimeters are made by conducting materials.
- 55. (b) Triple point of water is 273.16 K.

**56.** (a)

**57.** (d)  $W = JQ \implies W = 4.2 \times 200 = 840 J$ .

**58.** (d) Temperature of mixture 
$$\theta = \frac{m_1c_1\theta_1 + m_2c_2\theta_2}{m_1c_1 + m_2\theta_2}$$

$$\Rightarrow 32 = \frac{m_1 \times 0.2 \times 40 + 100 \times 0.5 \times 20}{m_1 \times 0.2 + 100 \times 0.5} \Rightarrow m_1 = 375 \text{ gm}$$

**59.** (d) Suppose m gm ice melted, then heat required for its melting =  $mL = m \times 80$  cal

Heat available with steam for being condensed and then brought to  $0^\circ {\it C}$ 

$$=1 \times 540 + 1 \times 1 \times (100 - 0) = 640 \, cal$$

 $\Rightarrow$  Heat lost = Heat taken

$$\Rightarrow 640 = m \times 80 \Rightarrow m = 8 gm$$

Short trick: You can remember that amount of steam (m') at

100°*C* required to melt 
$$m gm$$
 ice at 0°*C* is  $m' = \frac{m}{8}$ 

Here, 
$$m = 8 \times m' = 8 \times 1 = 8 gm$$

$$\theta_{\rm mix} = \frac{m_W \theta_W - \frac{m_i L_i}{c_W}}{\frac{m_W \theta_W}{c_W}}$$

**60.** (b) For water and ice mixing 
$$\theta_{\text{mix}} = \frac{c_W}{m_i + m_W}$$

$$= \frac{20 \times 40 - \frac{5 \times 80}{1}}{5 + 20} = 16^{\circ}C$$
(c)  $\theta_{\text{mix}} = \frac{m_W \theta_W - \frac{m_i L_i}{c_W}}{m_i + m_W}$ 

61.

$$\therefore m_i = m_W \Longrightarrow \theta_{mix} = \frac{\theta_W - \frac{L_i}{c_W}}{2} = \frac{80 - \frac{336}{4.2}}{2} = 0^{\circ}C$$

**62.** (a) When the relative humidity is low (approx. 25%), the evaporation from our body is faster. Thus we feel colder.

63. (a) 
$$c = \frac{Q}{m.\Delta\theta} \rightarrow \frac{J}{kg \times {}^{\circ}C}$$
  
64. (a)  $\theta_{min} = \frac{\theta_W - \frac{L_i}{c_W}}{\frac{1}{c_W}} = \frac{80 - \frac{80}{1}}{\frac{1}{c_W}}$ 

- 4. (a)  $\theta_{\text{mix}} = \frac{c_W}{2} = \frac{1}{2} = 0$
- 65. (a) Freezing point of water decreases when pressure increases, because water expands on solidification while "except water" for other liquid freezing point increases with increase in pressure.

Since the liquid in question is water. Hence, it expands on freezing.

**66.** (c) Partial pressure of water vapour  $P_W = 0.012 \times 10^5 \ Pa$ ,

Vapour pressure of water  $P_V = 0.016 \times 10^5 Pa$ .

The relative humidity at a given temperature is given by Partial pressure of water v apour

Vapour pressure of water  
= 
$$\frac{0.012 \times 10^5}{0.016 \times 10^5} = 0.75 = 75\%$$

**67.** (a) 
$$W = JQ \implies \frac{1}{2} \left(\frac{1}{2} M v^2\right) = J(m.c.\Delta\theta)$$

$$\Rightarrow \frac{1}{4} \times 1 \times (50)^2 = 4.2[200 \times 0.105 \times \Delta\theta] \Rightarrow \Delta\theta = 7.1^{\circ}C$$

**68.** (a) 
$$536 \frac{cal}{gm} = \frac{536 \times 4.2 J}{10^{-3} kg} = 2.25 \times 10^6 J / kg$$

**69.** (a) Water has maximum specific heat.

**70.** (a) 
$$\theta_{\text{mix}} = \frac{\theta_W - \frac{L_i}{C_W}}{2} = \frac{100 - \frac{80}{1}}{2} = 10^{\circ}C$$

71. (b) Suppose *m kg* of ice melts then by using 
$$\underset{\text{(Joules)}}{W} = \underset{\text{(Joules)}}{H}$$
  
 $\Rightarrow Mgh = mL \Rightarrow 3.5 \times 10 \times 2000 = m \times 3.5 \times 10^5$   
 $\Rightarrow m = 0.2 kg = 200 gm$ 

72. (d) 
$$\theta_{\text{mix}} = \frac{m_W \theta_W - \frac{m_i L_i}{S_W}}{m_i + m_W} = \frac{300 \times 25 - \frac{100 \times 80}{1}}{100 + 300} = -1.25^{\circ} C$$

Which is not possible. Hence  $\theta_{mix} = 0^{o} C$ 

**73.** (c) Ice  $(0^{\circ}C)$  converts into steam  $(100^{\circ}C)$  in following three steps.

Steam at  $100^{\circ}C$ 

3.

4.

5.

6.

Total heat required  $Q = Q_1 + Q_2 + Q_3$ = 5 × 80 + 5 × 1 × (100 - 0) + 5 × 540 = 3600 *cal* 

74. (a) Let L be the latent heat and using principle of calorimetry.  $2L + 2 (100 - 54.3) = 40 \times (54.3 - 25.3)$  $\Rightarrow L = 540.3 \text{ cal/gm}.$ 

**75.** (d) 
$$\theta_{\text{mix}} = \frac{m_W \theta_W - \frac{m_i L_i}{c_W}}{m_i + m_W} = \frac{100 \times 50 - 10 \times \frac{80}{1}}{10 + 100} \approx 38.2^{\circ}C$$

**76.** (b) Let the final temperature be  $T \circ C$ . Total heat supplied by the three liquids in coming down to  $0 \circ C = m_1 c_1 T_1 + m_2 c_2 T_2 + m_3 c_3 T_3$  ..... (i) Total heat used by three liquids in raising temperature from  $0 \circ C$  to  $T \circ C$ 

$$= m_1 c_1 T + m_2 c_2 T + m_3 c_3 T \qquad \dots \dots (ii)$$

By equating (i) and (ii) we get 
$$(m_1 c_1 + m_2 c_2 + m_3 c_2)T$$

$$(m_1c_1 + m_2c_2 + m_3c_3)$$

 $= m_1 c_1 T_1 + m_2 c_2 T_2 + m_3 c_3 T_3$ 

$$\Rightarrow T = \frac{m_1 c_1 T_1 + m_2 c_2 T_2 + m_3 c_3 T_3}{m_1 c_1 + m_2 c_2 + m_3 c_3}.$$

77. (c) At triple point all the phases co-exist

**78.** (b) 
$$c = \frac{Q}{m \cdot \Delta \theta}$$
; as  $\Delta \theta = 0$ , hence c becomes  $\infty$ .

- 79. (d) Let final temperature of water be  $\theta$ Heat taken = Heat given  $110 \times 1 (\theta - 10) + 10 (\theta - 10) = 220 \times 1 (70 - \theta)$  $\Rightarrow \theta = 48.8^{\circ}C \approx 50^{\circ}C.$
- 80. (c) We know that thermal capacity of a body expressed in calories is equal to water equivalent of the body expressed in grams.

**81.** (b) 
$$\theta_{mix} = \frac{m_1 c_1 \theta_1 + m_2 c_2 \theta_2}{m_1 c_1 + m_2 c_2} = \frac{m s (2t) + 1.5 (m s) \times \frac{t}{3}}{m s + 1.5 (m s)} = t$$

82. (d) We know that when solid carbondioxide is heated, it becomes vapour directly without passing through its liquid phase. Therefore it is called dry ice.

#### **Critical Thinking Questions**

1. (c) Due to volume expansion of both mercury and flask, the change in volume of mercury relative to flask is given by  $\Delta V = V_0 [\gamma_L - \gamma_g] \Delta \theta = V [\gamma_m - 3\alpha_g] \Delta \theta$ 

$$= 50 [180 \times 10^{-6} - 3 \times 9 \times 10^{-6}](38 - 18) = 0.153 cc$$

2. (a) 
$$\gamma_{-} = \gamma_{-} + \gamma_{-}$$
  
So  $(\gamma_{-} + \gamma_{-})_{-} = (\gamma_{-} + \gamma_{-})_{-}$   
 $\Rightarrow 153 \times 10^{\circ} + (\gamma_{-})_{-} = (144 \times 10^{\circ} + \gamma_{-})_{-}$   
Further,  $(\gamma)_{-} = 3\alpha = 3 \times (12 \times 10^{\circ}) = 36 \times 107^{\circ}C$   
 $\Rightarrow 153 \times 10^{\circ} + (\gamma_{-})_{-} = 144 \times 10^{\circ} + 36 \times 10^{\circ}$   
 $\Rightarrow (\gamma_{-})_{-} = 3\alpha = 27 \times 10^{\circ}/^{\circ}C \Rightarrow \alpha = 9 \times 10^{\circ}/^{\circ}C$ 

(d) The expansion of solids can be well understood by potential energy curve for two adjacent atoms in a crystalline solid as a function of their internuclear separation (*r*).

At ordinary temperatu  $r_2$  reach molecule of the solid vibrate about it's equilibrium position *P* between *A* and *B* (*r* is the equilibrium distance of it from some other molecule)

At high temperature : Amplitude of vibration increase ( $C \leftrightarrow D$  and  $E \leftrightarrow F$ ). Due to asymmetry of the curve, the equilibrium positions (P and P) of molecule displaced. Hence it's distance from other molecule increases (r > r > r).

Thus, on raising the temperature, the average equilibrium distance between the molecules increases and the solid as a whole expands.

(c) Initial diameter of tyre = (1000 - 6) mm = 994 mm, so initial  
radius of tyre 
$$R = \frac{994}{2} = 497 mm$$

and change in diameter  $\Delta D = 6 mm$  so  $\Delta R = \frac{6}{2} = 3 mm$ 

After increasing temperature by  $\Delta\theta$  tyre will fit onto wheel Increment in the length (circumference) of the iron tyre

$$\Delta L = L \times \alpha \times \Delta \theta = L \times \frac{\gamma}{3} \times \Delta \theta \qquad [\text{As } \alpha = \frac{\gamma}{3}]$$
$$2\pi \Delta R = 2\pi R \left(\frac{\gamma}{3}\right) \Delta \theta \Longrightarrow \Delta \theta = \frac{3}{\gamma} \frac{\Delta R}{R} = \frac{3 \times 3}{3.6 \times 10^{-5} \times 497}$$

 $\Rightarrow \Delta \theta = 500^{\circ} C$ 

(b) Due to volume expansion of both liquid and vessel, the change in volume of liquid relative to container is given by  $\Delta V = V_0 [\gamma_L - \gamma_e] \Delta \theta$ 

Given  $V = 1000 \ cc, \ \alpha = 0.1 \times 10^{-1/\circ} C$ 

:.  $\gamma_{g} = 3\alpha_{g} = 3 \times 0.1 \times 10^{-4} / {}^{\circ}C = 0.3 \times 10^{-4} / {}^{\circ}C$ 

 $\therefore \Delta V = 1000 [1.82 \times 10^{\circ} - 0.3 \times 10^{\circ}] \times 100 = 15.2 \text{ cc}$ 

(a) With temperature rise (same 25°C for both), steel scale and copper wire both expand. Hence length of copper wire *w.r.t.* steel scale or apparent length of copper wire after rise in temperature

$$L_{app} = L'_{cu} - L'_{steel} = [L_0(1 + \alpha_{Cu}\Delta\theta) - L_0(1 + \alpha_s\Delta\theta)$$
$$\Rightarrow L_{app} = L_0(\alpha_{Cu} - \alpha_s)\Delta\theta$$

$$= 80(17 \times 10^{-6} - 11 \times 10^{-6}) \times 20 = 80.0096 \ cm$$

Brass strin

**7.** (b, d) Let L be the initial length of each strip before heating.

Length after heating will be

$$L_{B} = L_{0}(1 + \alpha_{B}\Delta T) = (R + d)\theta$$

$$L_{C} = L_{0}(1 + \alpha_{C}\Delta T) = R\theta$$
Copper strip
$$R = \theta$$

15.

16.

19.

$$\Rightarrow \frac{R+d}{R} = \frac{1+\alpha_B \Delta T}{1+\alpha_C \Delta T}$$
$$\Rightarrow 1 + \frac{d}{R} = 1 + (\alpha_B - \alpha_C) \Delta T$$
$$\Rightarrow R = \frac{d}{(\alpha_B - \alpha_C) \Delta T} \Rightarrow R \propto \frac{1}{\Delta T} \text{ and } R \propto \frac{1}{(\alpha_B - \alpha_C)}$$

- 8. (d) Thermostat is used in electric apparatus like refrigerator, Iron etc for automatic cut off. Therefore for metallic strips to bend on heating their coefficient of linear expansion should be different.
- 9. (c) As the coefficient of cubical expansion of metal is less as compared to the coefficient of cubical expansion of liquid, we may neglect the expansion of metal ball. So when the ball is immersed in alcohol at 0°C, it displaces some volume V of alcohol at 0°C and has weight W.

$$W = W - V \rho_{g}$$

where W = weight of ball in air

Similarly,  $W = W - V\rho_g g$ 

where  $\rho_{\rm e}$  = density of alcohol at 0°C and  $\rho_{\rm w}$  = density of alcohol at 50°C

As  $\rho_{1} < \rho_{2} \Rightarrow W > W$  or W < W

10. (d) 
$$V = V(1 + \gamma \Delta \theta) \implies$$
 Change in volume

$$V - V_0 = \Delta V = A \cdot \Delta l = V_0 \gamma \Delta \theta$$

$$\Rightarrow \Delta I = \frac{V_0 \cdot \Delta \theta}{A} = \frac{10^{-6} \times 18 \times 10^{-5} \times (100 - 0)}{0.004 \times 10^{-4}}$$

 $= 45 \times 10^{\circ} m = 4.5 cm$ 

11.

12.

(b) Loss of weight at  $27^{\circ}C$  is

= 
$$46 - 30 = 16 = V \times 1.24 \ \rho \times g$$
 ...(i)  
Loss of weight at  $42^{\circ}C$  is  
=  $46 - 30.5 = 15.5 = V \times 1.2 \ \rho \times g$  ...(ii)

Now dividing (i) by (ii), we get  $\frac{16}{15.5} = \frac{V_1}{V_2} \times \frac{1.24}{1.2}$ 

But 
$$\frac{V_2}{V_1} = 1 + 3\alpha (t - t) = \frac{15.5 \times 1.24}{16 \times 1.2} = 1.001042$$

$$\Rightarrow 3\alpha (42^{\circ} - 27^{\circ}) = 0.001042 \Rightarrow \alpha = 2.316 \times 10^{\circ}/^{\circ}C.$$

(b) Substances are classified into two categories

(i) water like substances which expand on solidification.

(ii) CO like (Wax, Ghee etc.) which contract on solidification.

Their behaviour regarding solidification is opposite.

Melting point of ice decreases with rise of temp but that of wax etc increases with increase in temperature. Similarly ice starts forming from top downwards whereas wax starts its formation from bottom.

**13.** (b) Heat lost in t sec = 
$$mL$$
 or heat lost per sec =  $\frac{mL}{t}$ . This must

be the heat supplied for keeping the substance in molten state per sec.

$$\therefore \quad \frac{mL}{t} = P \quad \text{or} \quad L = \frac{Pt}{m}$$

14. (a) Heat is lost by steam in two stages (i) for change of state from steam at  $100^{\circ}C$  to water at  $100^{\circ}C$  is  $m \times 540$  (ii) to change water at  $100^{\circ}C$  to water at  $80^{\circ}C$  is  $m \times 1 \times (100 - 80)$ , where *m* is the mass of steam condensed.

Total heat lost by steam is  $m \times 540 + m \times 20 = 560 m$  (*cals*) Heat gained by calorimeter and its contents is

 $= (1.1 + 0.02) \times (80 - 15) = 1.12 \times 65$  cals.

using Principle of calorimetery, Heat gained = heat lost

 $\therefore$  560  $m = 1.12 \times 65$ ,  $m = 0.130 \ gm$ 

(b) Initially ice will absorb heat to raise it's temperature to 0 C then it's melting takes place

If m = Initial mass of ice, m' = Mass of ice that melts and m = Initial mass of water

By Law of mixture Heat gained by ice = Heat lost by water  $\Rightarrow$  $m_i \times c \times (20) + m_i' \times L = m_w c_w [20]$ 

$$\Rightarrow 2 \times 0.5(20) + m_i' \times 80 = 5 \times 1 \times 20 \Rightarrow m_i' = 1 kg$$

So final mass of water = Initial mass of water + Mass of ice that melts = 5 + 1 = 6 kg.

 (a) Heat gained by the water = (Heat supplied by the coil) – (Heat dissipated to environment)

$$\Rightarrow mc \ \Delta\theta = P_{Coil} \ t - P_{Loss} \ t$$

$$\Rightarrow 2 \times 4.2 \times 10^3 \times (77 - 27) = 1000 t - 160 t$$

$$\Rightarrow t = \frac{4.2 \times 10^5}{840} = 500 \ sec = 8 \ min \ 20 \ sec$$

17. (a) If mass of the bullet is *m gm*,

then total heat required for bullet to just melt down

$$Q = m c \Delta \theta + m L = m \times 0.03 (327 - 27) + m \times 6$$

$$= 15 m cal = (15m \times 4.2)J$$

Now when bullet is stopped by the obstacle, the loss in its mechanical energy  $=\frac{1}{2}(m\times 10^{-3})v^2 J$ 

$$(As m gm = m \times 10^{-3} kg)$$

As 25% of this energy is absorbed by the obstacle,

The energy absorbed by the bullet

$$Q_2 = \frac{75}{100} \times \frac{1}{2} mv^2 \times 10^{-3} = \frac{3}{8} mv^2 \times 10^{-3} J$$

Now the bullet will melt if  $Q_2 \ge Q_1$ 

*i.e.* 
$$\frac{3}{8}mv^2 \times 10^{-3} \ge 15m \times 4.2 \Rightarrow v_{\min} = 410 \ m/s$$

**18.** (c) Energy = 
$$\frac{1}{2}mv^2 = mc \Delta\theta$$
;  $\Rightarrow \Delta\theta \propto v^2$ 

Temperature does not depend upon the mass of the balls. (c) Heat gain = heat lost

$$C_{1}(16 - 12) = C_{1}(19 - 16) \Rightarrow \frac{C_{A}}{C_{B}} = \frac{3}{4}$$
  
and  $C_{1}(23 - 19) = C_{1}(28 - 23) \Rightarrow \frac{C_{B}}{C_{C}} = \frac{5}{4}$ 

$$\Rightarrow \frac{C_A}{C_C} = \frac{15}{16} \qquad \dots (i)$$

If  $\theta$  is the temperature when A and C are mixed then,

$$C_A(\theta - 12) = C_C(28 - \theta) \Rightarrow \frac{C_A}{C_C} = \frac{28 - \theta}{\theta - 12}$$
...(ii)

On solving equation (i) and (ii)  $\theta$  = 20.2°C.

20.

- (b) Suppose *m kg* steam required per hour Heat released by steam in following three steps
  - (i) When 150°C steam  $\longrightarrow 100^{\circ}C$  steam
    - $Q = mc_{\Delta} \Delta \theta = m \times 1 (150 100) = 50 m cal$
  - (ii) When 150°C steam  $\longrightarrow 0_2 \rightarrow 100^{\circ}C$  water
    - $Q = mL = m \times 540 = 540 m cal$
  - (iii) When 100°C water  $\longrightarrow 90^{\circ}C$  water

$$Q = mc \ \Delta \theta = m \times 1 \times (100 - 90) = 10 \ m \ cal$$

Hence total heat given by the steam  $Q = Q_i + Q_i + Q_i = 600 \text{ mcal}$  ... (i)

Heat taken by 10 kg water

$$Q' = mc_W \Delta \theta = 10 \times 10^3 \times 1 \times (80 - 20) = 600 \times 10^3 cal$$

Hence 
$$Q = Q \Longrightarrow 600 \ m = 600 \times 10^{\circ}$$

 $\Rightarrow$  m = 10<sup>o</sup> gm = 1kg.

**21.** (a) Suppose, height of liquid in each arm before rising the temperature is *l*.

With temperature rise height of liquid in each arm increases *i.e.* l > l and l > l

Also 
$$l = \frac{l_1}{1 + \gamma t_1} = \frac{l_2}{1 + \gamma t_2}$$
  
 $\Rightarrow l_1 + \gamma l_1 t_2 = l_2 + \gamma l_2 t_1 \Rightarrow \gamma = \frac{l_1 - l_2}{l_2 t_1 - l_1 t_2}$ 

**22.** (c)  $V = V_0 (1 + \gamma \Delta \theta)$ 

$$L^{3} = L_{0}(1 + \alpha_{1}\Delta\theta)L_{0}^{2}(1 + \alpha_{2}\Delta\theta)^{2} = L_{0}^{3}(1 + \alpha_{1}\Delta\theta)(1 + \alpha_{2}\Delta\theta)^{2}$$
  
Since  $L_{0}^{3} = V_{0}$  and  $L^{3} = V$ 

Hence 
$$1 + \gamma \Delta \theta = (1 + \alpha_1 \Delta \theta)(1 + \alpha_2 \Delta \theta)^2$$

$$\cong (1 + \alpha_1 \Delta \theta)(1 + 2\alpha_2 \Delta \theta) \cong (1 + \alpha_1 \Delta \theta + 2\alpha_2 \Delta \theta)$$

$$\Rightarrow \gamma = \alpha + 2\alpha$$

23. (d) 
$$(OR)^2 = (PR)^2 - (PO)^2 = l^2 - \left(\frac{l}{2}\right)^2$$
  
=  $[l(1 + \alpha_2 t)]^2 - \left[\frac{l}{2}(1 + \alpha_1 t)\right]^2$ 

$$t^{2} - \frac{l^{2}}{4} = l^{2}(1 + \alpha_{2}^{2}t^{2} + 2\alpha_{2}t) - \frac{l^{2}}{4}(1 + \alpha_{1}^{2}t^{2} + 2\alpha_{1}t)$$

Neglecting  $\alpha_2^2 t^2$  and  $\alpha_1^2 t^2$ 

$$0 = l^2(2\alpha_2 t) - \frac{l^2}{4}(2\alpha_1 t) \Longrightarrow 2\alpha_2 = \frac{2\alpha_1}{4} \Longrightarrow; \alpha_1 = 4\alpha_2$$

24. (c) It is given that the volume of air in the flask remains the same. This means that the expansion in volume of the vessel is exactly equal to the volume expansion of mercury.

*i.e.*, 
$$\Delta V_g = \Delta V_L$$
 or  $V_g \gamma_g \Delta \theta = V_L \gamma_L \Delta \theta$ 

$$V_L = \frac{V_g \gamma_g}{\gamma_L} = \frac{1000 \times (3 \times 9 \times 10^{-6})}{1.8 \times 10^{-4}} = 150 \ cc$$

**25.** (c) Heat given by water  $Q_1 = 10 \times 10 = 100$  cal.

Heat taken by ice to melt

$$Q = 10 \times 0.5 \times [0 - (-20)] + 10 \times 80 = 900 \ cal$$

As  $Q_1 < Q_2$ , so ice will not completely melt and final temperature = 0°*C*.

As heat given by water in cooling up to  $0^{\circ}C$  is only just sufficient to increase the temperature of ice from  $-20^{\circ}C$  to  $0^{\circ}C$ , hence mixture in equilibrium will consist of 10 *gm* ice and 10 *gm* water at  $0^{\circ}C$ .

**26.** (b) 
$$\Delta L = L_0 \alpha \Delta \theta$$

27.

Rod 
$$A: 0.075 = 20 \times \alpha \times 100 \Rightarrow \alpha_A = \frac{75}{2} \times 10^{-6} / {}^{\circ}C$$
  
rod  $B: 0.045 = 20 \times \alpha \times 100 \Rightarrow \alpha_B = \frac{45}{2} \times 10^{-6} / {}^{\circ}C$ 

For composite rod :  $x \ cm$  of A and  $(20 - x) \ cm$  of B we have

$$0.060 = x \alpha \times 100 + (21)$$

$$= x \left[ \frac{75}{2} \times 10^{-6} \times 100 + (20 - x) \times \frac{45}{2} \times 10^{-6} \times 100 \right]$$

On solving we get x = 10 cm.

 (a) Let *m gm* of steam get condensed into water (By heat loss). This happens in following two steps.

$$100^{\circ}C$$
Steam
$$(H_{1} = m \times 540)$$

$$[H_{2} = m \times 1 \times (100 - 90)]$$

$$90^{\circ}C$$
Water
$$Water$$

Heat gained by water  $(20^{\circ}C)$  to raise it's temperature upto  $90^{\circ} = 22 \times 1 \times (90 - 20)$ 

Hence, in equilibrium heat lost = Heat gain

$$\Rightarrow m \times 540 + m \times 1 \times (100 - 90) = 22 \times 1 \times (90 - 20)$$

$$\Rightarrow m = 2.8 \ gm$$

The net mass of the water present in the mixture = 22 + 2.8 = 24.8 gm.

#### **Graphical Questions**

1. (b) Relation between Celsius and Fahrenheit scale of temperature is C = F - 32 , 5 = 160

$$\frac{1}{5} = \frac{1}{9} \implies C = \frac{1}{9}F - \frac{1}{9}$$

Equating above equation with standard equation of line

$$y = mx + c$$
 we get slope of the line *AB* is  $m = \frac{2}{2}$ 

2. (c) Since in the region AB temperature is constant therefore at this temperature phase of the material changes from solid to liquid and (H - H) heat will be absorb by the material. This heat is known as the heat of melting of the solid.

Similarly in the region *CD* temperature is constant therefore at this temperature phase of the material changes from liquid to gas and (H - H) heat will be absorb by the material. This heat as known as the heat of vaporisation of the liquid.

- (a) Initially, on heating temperature rises from -10°C to 0°C. Then ice melts and temperature does not rise. After the whole ice has melted, temperature begins to rise until it reaches 100°C. Then it becomes constant, as at the boiling point will not rise.
- 4. (a) The volume of matter in portion *AB* of the curve is almost constant and pressure is decreasing. These are the characteristics of liquid state.
- **5.** (d) Let the quantity of heat supplied per minute be *Q*. Then quantity of heat supplied in 2 min = mC(90 80)

ln 4 min, heat supplied = 2m C(90 - 80)

$$\therefore 2m C(90-80) = m L \implies \frac{L}{C} = 20$$

- 6. (b) In the given graph *CD* represents liquid state.
- 7. (a) Density of water is maximum at  $4^{\circ}C$  and is less on either side of this temperature.
- 8. (a) We know that,  $\frac{C}{100} = \frac{F-32}{180}$  or  $F = \frac{9}{5}C + 32$

Equation of straight line is, y = mx + cHence, m = (9 / 5), positive and c = 32positive. The graph is shown in figure.

**9.** (a)

$$\frac{C}{5} = \frac{F - 32}{9} \Longrightarrow$$

0

$$C = \left(\frac{5}{9}\right)F - \frac{20}{3}.$$
 Hence graph between °*C* and °*F* will be a

straight line with positive slope and negative intercept.

10. (bc) The horizontal parts of the curve, where the system absorbs heat at constant temperature must depict changes of state. Here the latent heats are proportional to lengths of the horizontal parts. In the sloping parts, specific heat capacity is inversely proportional to the slopes.

**11.** (c) Since specific heat = 0.6 
$$kca \|gm \times {}^{\circ}C = 0.6 ca \|gm \times {}^{\circ}C$$

From graph it is clear that in a minute, the temperature is raised from  $0^{\circ}C$  to  $50^{\circ}C$ .

 $\Rightarrow$  Heat required for a minute = 50 × 0.6 × 50 = 1500 *cal.* 

Also from graph, Boiling point of wax is 200°C.

13.

з.

4.

5.

(c) Substances having more specific heat take longer time to get heated to a higher temperature and longer time to get cooled.

If we draw a line part to the time axis then it cuts the given graphs at three different points. Corresponding  $^{t}$  points on the times axis shows that

$$t_C > t_B > t_A \implies C_C > C_B > C_A$$

14. (c) From given curve,

Melting point for  $A = 60^{\circ}C$ 

and melting point for  $B = 20^{\circ}C$ 

Time taken by A for fusion =(6-2)=4 minute

Time taken by *B* for fusion 
$$=(6.5-4)=2.5$$
 minute

Then 
$$\frac{H_A}{H_B} = \frac{6 \times 4 \times 60}{6 \times 2.5 \times 60} = \frac{8}{5}$$
.

#### Assertion and Reason

- (a) With rise in pressure melting point of ice decreases. Also ice contracts on melting
- (c) Celsius scale was the first temperature scale and Fahrenheit is the smallest unit measuring temperature.
  - (e) Melting is associated with increasing of internal energy without change in temperature. In view of the reason being correct the amount of heat absorbed or given out during change of state is expressed Q = mL, where *m* is the mass of the substance and *L* is the latent heat of the substance.
  - (a) The temperature of land rises rapidly as compared to sea because of specific heat of land is five times less than that of sea water. Thus, the air above the land become hot and light so rises up so because of pressure drops over land. To compensate the drop of pressure, the cooler air starts from sea starts blowing towards lands, so, setting up sea breeze. During night land as well sea radiate heat energy. The temperature of land falls more rapidly as compared to sea water, as sea water consists of higher specific heat capacity. The air above sea water being warm and light rises up and to take its place the cold air from land starts blowing towards sea and so et up breeze.
  - (a) Linear expansion for brass  $(19 \times 10^{-4}) >$  linear expansion for steel  $(11 \times 10^{-4})$ . On cooling the disk shrinks to a greater extent than the hole and hence it will get loose.
- **6.** (a) As,  $\gamma = \frac{\Delta V}{V\Delta T}$  *i.e.*, units of coefficient of volume expansion is *K*.

7. (c) The relation between *F* and *C* scale is,  $\frac{C}{5} = \frac{F-32}{9}$ . If F = C

 $\Rightarrow$  C = - 40°C *i.e.*, at - 40° the Centigrade and Fahrenheit thermometers reads the same.

- 8. (a) As  $\beta = 2\alpha$  and  $\gamma = 3\alpha$ , *i.e.*, coefficient of volume expansion of solid is three time coefficient of linear expansion and 1.5 times the coefficient of superficial expansion, on heating a solid iron ball, percentage increase in its volume is largest.
- 9. (a) Water has maximum density at 4°C. On heating above 4°C or cooling below 4°C, density of water decreases and its volume increases. Therefore, water overflows in both the cases.
- 10. (b) The Latent heat of fusion of ice is amount of heat required to convert unit mass of ice at 0° C into water at 0° C. For fusion of ice

 $L = 80 \ cal \ gm = 80000 \ cal \ gm = 8000 \times 4.2 \ J \ kg$ 

= 336000 J / kg.

- **11.** (a) When two bodies at temperature  $T_1$  and  $T_2$  are brought in thermal contact, they do settle to the mean temperature  $(T_1 + T_2)/2$ . They will do so, in case the two bodies were of same mass and material *i.e.*, same thermal capacities. In other words, the two bodies may be having different thermal capacities, that's why they do not settle to the mean temperature, when brought together.
- 12. (d) Specific heat of a body is the amount of heat required to raise the temperature of unit mass of the body through unit degree. When mass of a body is less than unity, then its thermal capacity is less than its specific heat and vice-versa.
- (a) Water would evaporate quickly because there is no atmosphere on moon, due to which surface temperature of moon is much higher than earth (Maximum surface temperature of moon is 123° C).
- 14. (d) The potential energy of water molecules is more. The heat given to melt the ice at  $0^{\circ}C$  is used up in increasing the potential energy of water molecules formed at  $0^{\circ}C$ .

(SET -12)

 (b) When salt crystals dissolves, crystal lattice is destroyed. The process requires a certain amount of energy (latent heat) which is taken from the water.

In vessel (B), a part of intermolecular bonds has already been destroyed in crushing the crystal. Hence less energy is require to dissolve the powder and the water will be at higher temperature.

- (a) Fire is extinguished by the vaporisation do water which lowers the temperature of the burning body. Further, the water vapour envelops the body, keeping oxygen away. Hot water evaporates more than cold water as
- 3. (c) The thermometer has to attain the temperature of the body. To do this, it should draw as little heat from the body as possible, so that the existing temperature of the body is not disturbed.

4. (b) As we know 
$$\alpha = \frac{\Delta L}{L_0 \Delta \theta} \Rightarrow \Delta \theta = \frac{\Delta L}{\alpha L_0} = \frac{5 \times 10^{-5}}{10 \times 10^{-6} \times 1} = 5^{\circ}C$$

5. (b) Since  $102.2^{\circ}F \rightarrow 39^{\circ}C$  and  $98.6^{\circ}F \rightarrow 39^{\circ}C$ 

Hence  $\Delta Q$  = m. s.  $\Delta Q$  = 80 × 1000 × (39 - 37)

 $= 16 \times 10^{\circ} cal = 160 kcal.$ 

**6.** (b) If the sheet is heated then both *d* and *d* will increase since the thermal expansion of isotropic solid is similar to true photographic enlargement.

7. (a) 
$$W = JQ \Rightarrow \frac{1}{2}I\omega^2 = J(MS\Delta\theta) \Rightarrow \frac{1}{2}\left(\frac{2}{5}MR^2\right)\omega^2$$
  
 $= J(MS\Delta\theta) \Rightarrow \Delta\theta = \frac{R^2\omega^2}{5Js}$ 

8. (b) 
$$W = JQ = J(mL) \Rightarrow P \times t = J(mL) \Rightarrow P = J\left(\frac{m}{t}\right)L;$$

where  $\frac{m}{t}$  = rate of melting of ice by chewing =  $\frac{60 \ gm}{min} = \frac{1 \ gm}{sec} \implies P = 4.2 \times 1 \times 80 = 336 \ W.$ 

9. (c) 
$$\frac{X-L}{U-L} = \frac{C}{100} \Rightarrow \frac{62-(10)}{110-(-10)} = \frac{C}{100}$$
 (C = 60°C)

10. (d) Heat released to convert  $x \ gm$  of steam at 100°C to water at 100°C is  $x \times 540$  cals.

If *y* gm of ice is converted from  $0^{\circ}C$  to water at  $100^{\circ}C$  it requires heat  $y \times 80 + y \times 1 \times 100 = 180 y$ 

$$\therefore x \times 540 = 180 y \text{ or } \frac{y}{x} = \frac{540}{180} = \frac{3}{1}$$

(b) When length of the liquid column remains constant, then the level of liquid moves down with respect to the container, thus γ must be less than 3α.

Now we can write  $V = V(1 + \gamma \Delta T)$ Since  $V = AI = [A (1 + 2\alpha\Delta T)]I = V (1 + 2\alpha\Delta T)$ Hence  $V(1 + \gamma\Delta T) = V(1 + 2\alpha\Delta T) \Longrightarrow \gamma = 2\alpha$ .

**12.** (c) By using

13.

$$\Delta\theta = 0.0023 \, h = 0.0023 \times 500 = 1.15^{\circ}C \approx 1.16^{\circ}C$$

(b) According to energy conservation, change in potential energy of the ball, appears in the form of heat which raises the temperature of the ball.

*i.e.* 
$$mg(h_1 - h_2) = m.c.\Delta\theta$$
  

$$\Rightarrow \Delta\theta = \frac{g(h_1 - h_2)}{c}$$

$$= \frac{10(10 - 5.4)}{460} = 0.1^{\circ}C$$
(c)  $\theta_{mix} = \frac{\theta_w - \frac{L_i}{C_W}}{2} = \frac{100 - \frac{80}{1}}{2} = 10^{\circ}C$ 

14. (c) 
$$\theta_{\text{mix}} = \frac{C_W}{2} = \frac{1}{2} = 10^{\circ}C$$

15. (c) lce  $(0^{\circ}C)$  converts into water  $(100^{\circ}C)$  in following two steps.

$$(Q_{1} = mL_{i})$$

$$(Q_{1} = mL_{i})$$

$$(Q_{2} = mc_{W}\Delta\theta)$$
Water at 10°C
Water at 100°C

Total heat required

$$Q = Q_1 + Q_2 = 1 \times 80 + 1 \times 1 \times (100 - 0) = 180 \ cal$$
