14. Alkenes

Alkenes:

- General formula is C_nH_{2n} .
- Isomerism
- 1.Position isomer

$$\begin{array}{c} ^{1} \text{CH}_{2} = \overset{2}{\text{CH}} - \overset{3}{\text{CH}}_{2} - \overset{4}{\text{CH}}_{2} - \overset{5}{\text{CH}}_{3} \\ & \text{Pent} - 1 - \text{ene} \\ ^{1} \text{CH}_{3} - \overset{2}{\text{CH}} = \overset{3}{\text{CH}} - \overset{4}{\text{CH}}_{2} - \overset{5}{\text{CH}}_{3} \\ & \text{Pent} - 2 - \text{ene} \end{array}$$

2. Geometrical isomerism

• Cis-isomer: Two identical atoms or groups are on the same side of the double bond

$$C = C$$
 CH_3
 $C = C$
 H
 Cis -But-2-ene

• Trans-isomer: Two identical atoms or groups lie on the opposite side of the double bond

$$C = C$$
 CH_3
 CH_3
 CH_3

Alkenes:

- General formula is C_nH_{2n} .
- Alkenes are unsaturated hydrocarbons containing at least one double bond.
- Carbon-carbon double bond in alkenes consist of one sigma bond and one pi bond.

• Prepared by:

- Partial reduction of alkynes
- Dehydrohalogenation by heating alkyl halides with acloholic KOH
- Dehalogenation by reacting vicinal dihalides with Zn metal
- Dehydration of alcohols using
 - Concentrated H₂SO₄
 - Heated Al₂O₃

• Properties:

- Colourless, odourless, insoluble in water and fairly soluble in non-polar solvents
- Undergo addition reactions:

- Addition of hydrogen to form alkanes
- Addition of halogen to form dihalides
- Addition of hydrogen halide to form alkyl halides
- Addition of H₂SO₄
- Addition of water
- Oxidation of alkenes with
 - Baeyer's reagent converts them to vicinal glycols
 - Acidic KMnO₄ or acidic K₂Cr₂O₇ oxidises them to give ketones or acids (depending upon the nature of alkenes)
- Undergoes ozonolysis to form aldehydes
- Polymerises at high temperature in presence of suitable catalyst
- Undergoes combustion to form a large amount of heat

• Uses:

- Manufacture of synthetic chemicals, polythene, raw materials for detergents
- For ripening of fruits
- producing oxy-ethylene
