

CH-12 ALGEBRAIC EXPRESSIONS

ALGEBRAIC EXPRESSION :

1. CONSTANT :- A term that has fixed value is called a constant.
for eg: 3, 5, 0, -7 etc
2. VARIABLE :- A term which does not have a fixed value. Letters of english alphabets are used for variables
for eg: x, y, z, s, t etc
3. TERM :- A term is a number (constant), a variable or a combination (product or quotient) of numbers and variables.
for eg: 7, y, 5b, xy, $\frac{-3x}{2y}$ etc
4. ALGEBRAIC EXPRESSION:-
A combination of one or more terms, which are separated by addition, subtraction is called an algebraic expression.
for eg: $4+10x$, $5x-7y$ etc

FACTORS :- Terms are made of the product of factors

for eg: the term $2xy$ of the expression $2xy + 7z$ has three factors 2, x and y.

COEFFICIENT :- Any of the factors of a term is called the coefficient of the product of remaining factors. In particular the constant is called "numerical coefficient" and the remaining part is called "literal coefficient".

for eg: Consider the expression
 $3x^2y + 7xy - 8$

In the term $3x^2y$

Numerical coefficient = 3

literal coefficient = x^2y

coefficient of x^2 = $3y$

coefficient of x = $3xy$

coefficient of y = $3x^2$

Q-4. What should be the value of a if the value of $2a^2 + b^2 = 10$ when $b = 2$?

Sol:

$$\begin{aligned} 2a^2 + b^2 &= 10 \\ 2(a)^2 + (2)^2 &= 10 \\ 2(a)^2 + 4 &= 10 \\ 2(a)^2 &= 10 - 4 \\ 2(a)^2 &= 6 \\ a^2 &= \frac{6}{2} \end{aligned}$$

$$\begin{aligned} a^2 &= 3 && \text{Ans} \\ a &= \pm\sqrt{3} \end{aligned}$$

Q-5 Find the value of x if $-3x + 7y^2 = 1$ when $y = 1$?

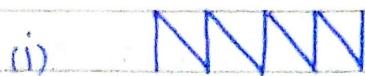

$$\begin{aligned} -3x + 7y^2 &= 1 \\ -3x + 7(1)^2 &= 1 \\ -3x + 7 &= 1 \\ -3x &= 1 - 7 \\ -3x &= -6 \\ x &= \frac{-6}{-3} = 2 \end{aligned}$$

$$x = 2 \quad \text{Ans}$$

Q-6 Observe the pattern of shapes of letters formed from line segment of equal lengths

If n shapes of letters are formed, then write the algebraic expression for the number of line segment required for making these n shapes in each case.

It consists of repetition of the shapes N made from 3 line segment.

So number of shapes and no. of line segments required are as below

No. of shapes formed	No. of line segments required
1	3
2	5
3	7
4	9

algebraic expression for
So, no. of line segment required
is $2n+1$

(ii)

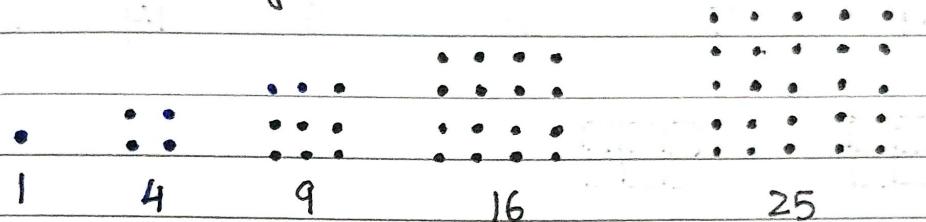

It consists of repetition of the shapes F made from 6 line segment. So number of shapes and no. of line segments required are as below

No. of shapes formed	No. of line segments required
1	8
2	14
3	20
4	26

So, algebraic expression for no. of line segment required is $4n+2$

Q-7 Observe the following pattern of squares made using dots

If n is taken as the number of dots in each row then find the algebraic expression for number of dots in n th figure. Also find number of dots

$$(i) n = 3$$

Acc to the given pattern, the algebraic expression for no. of dots is

$$n^2$$

$$\text{So if } n = 3$$

$$n^2 = 3^2 = 3 \times 3 = 9$$

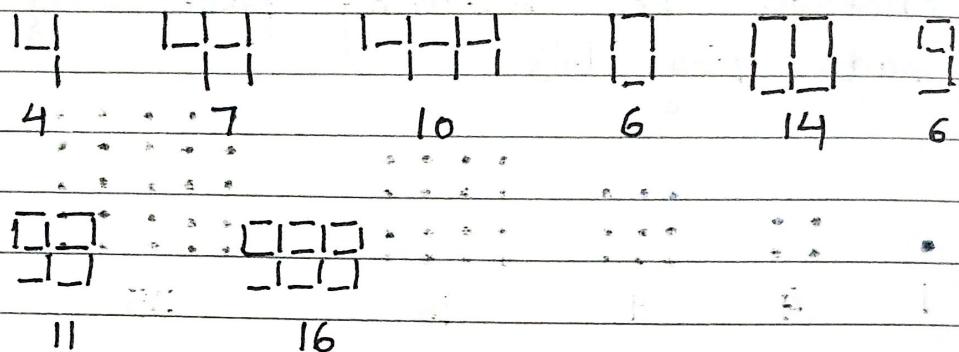

$$(ii) n = 7$$

$$\begin{aligned} & n^2 \\ &= (7)^2 \\ &= 49 \end{aligned}$$

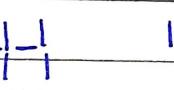

$$(iii) n = 10$$

$$\begin{aligned} & n^2 \\ &= (10)^2 \\ &= 100 \end{aligned}$$

Q-8 observe the pattern of shapes of digits formed from line segment of equal lengths

If n shapes of digits are formed then write the algebraic expression for the numbers of line segment required to make n shapes

Sol:

It consists of repetition of the shape  made from 4 line segments
so, algebraic expression would be $3n+1$

It consists of repetition of the shape  made from 6 line segments,
so algebraic expression would be $4n+2$
