

**CBSE Board**  
**Class XI Physics**

**Time: - 3**

**Marks: - 70 Marks**

---

**General Instructions**

- (a) All questions are compulsory.
- (b) There are 29 questions in total. Questions 1 to 8 carry one mark each, questions 9 to 16 carry two marks each, questions 17 to 25 carry three marks each and questions 27 to 29 carry five marks each.
- (c) Question 26 is a value based question carrying four marks.
- (d) There is no overall choice. However, an internal choice has been provided in one question of two marks, one question of three marks and all three questions of five marks each. You have to attempt only one of the given choices in such questions.
- (e) Use of calculator is not permitted.
- (f) You may use the following physical constants wherever necessary.

$$e = 1.6 \times 10^{-19} C$$

$$c = 3 \times 10^8 ms^{-1}$$

$$h = 6.6 \times 10^{-34} JS$$

$$\mu_o = 4\pi \times 10^{-7} NA^{-2}$$

$$k_B = 1.38 \times 10^{23} JK^{-1}$$

$$N_A = 6.023 \times 10^{23} / mole$$

$$m_n = 1.6 \times 10^{-27} kg$$

---

- 1. What is the fundamental unit of time and define it? (1)
- 2. Why does a cricket player lower his hands while catching the ball? (1)
- 3. Is friction an evil? (1)
- 4. What is the ratio of SI to CGS unit of work done? (1)
- 5. If there is no external force acting on a non rigid body, which of the following quantities must remain constant?  
Angular momentum, Linear momentum, Kinetic energy, Moment of Inertia (1)
- 6. Which is more elastic, steel or rubber? Why? (1)
- 7. Is it possible that there is no increase in the temperature of a body despite being heated? (1)

8. What is the maximum value of P.E in case of SHM? (1)
9. If the size of a nucleus is scaled up to the tip of a sharp pin, what roughly is the size of an atom? (2)
10. A body covers half of its journey with a speed of  $40 \text{ ms}^{-1}$  and the other half with a speed of  $60 \text{ ms}^{-1}$ . What is the average speed during the whole journey? (2)
11. A particle has a displacement of 12m towards east and 5m towards north and 6m vertically upwards. Find the magnitude of the sum of these displacements. (2)
12. Give two examples of zero work done. (2)
13.  
(a) What is the present accepted value of  $G$ ?  
(b) Define  $G$  in terms of the gravitational force between two masses. (2)
14.  
(a) Write the isothermal relation between pressure and volume.  
(b) Write an expression for work done during isothermal change. (2)
- OR**
- During an experiment, an ideal gas is found to obey an additional law  $VP^2 = \text{constant}$ . The gas is initially at a temperature  $T$  and volume  $V$ . When it expands to a volume  $2V$ , what does new temperature become. (2)
15. A graph was plotted taking  $\log_{10}T$  vs  $\log_{10}l$  for a simple pendulum. What is the nature of the graph and what is its slope? (2)
16. What do you mean by a closed organ pipe? (2)
17. It is easier to pull a lawn roller than to push it. Explain using the resolution of forces. (3)
18. Define coefficient of restitution. In an elastic collision of two bodies are the momentum and energy of each body conserved? Why is heavy water chosen in a nuclear reactor to slow down fast moving neutrons? (3)
19. A ball is dropped from rest at a height of 12 m. If it loses 25% of its kinetic energy on striking the ground, what is the height to which it bounces? How do you account for the loss in K.E? (3)

20. A uniform ladder of mass 10 kg leans against a smooth vertical wall making an angle of  $53^\circ$  with it. The other end rests on a rough horizontal floor. Find the normal force and the frictional force that the floor exerts on the ladder. (3)

21.

- (i) What is a geo-stationary satellite? Is it same as synchronous satellite?
- (ii) What is the height of a geostationary satellite?
- (iii) What do you mean by a parking orbit? (3)

**OR**

A 400kg satellite is in a circular orbit of radius  $2R_E$  about the earth. How much energy is required to transfer it to an orbit of radius  $4R_E$ ? What are the changes in its kinetic and potential energies? (3)

22. Define terminal velocity and show that the velocity  $v$  of a sphere of radius  $r$  and density  $\rho$  falling through a viscous fluid of density  $\sigma$  and coefficient of viscosity  $\eta$  is given by

$$v = \frac{2}{9} \frac{r^2 g (\rho - \sigma)}{\eta}$$

23.

- (a) Does the first law of thermodynamics violate the law of conservation of energy?
- (b) Write the limitations of the first law of thermodynamics. (3)

24. The absolute temperature of a gas is made four times. How many times will be

- (a) its total kinetic energy?
- (b) root mean-square velocity of its molecules?
- (c) How will pressure change? (3)

25. State Pascal's law. What is the pressure on a swimmer 10m below the surface of a lake? (3)

26. Sita, a student of class XII, was suffering from malaria. The area where she lived was full of mosquitoes. She was not having mosquito net. Her friend Gita had an extra net. She gave it to Sita. Also she took Sita to a Doctor, got her medicines. After a week Sita became normal.

- (a) Comment upon the qualities of Gita.
- (b) The mosquito net over a 7 m x 4m bed is 3m high. The net has a hole at one corner of the bed through which a mosquito enters the net. It flies and sits at the diagonally opposite upper corner of the net.
  - (i) Find the magnitude of the displacement of the mosquito.
  - (ii) Taking the hole as the origin, the length of the bed as the x-axis, its width as the y-axis and vertically up as the z-axis, write the components of the displacement vector. (4)

27.

(i)

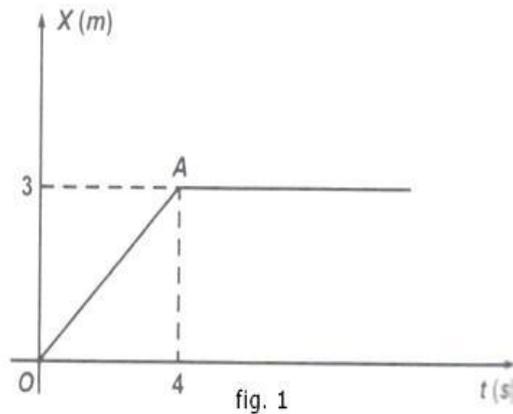

Figure 1 shows the position-time graph of a particle of mass 4 kg. What is the

(a) force on the particle for  $t < 0$ ,  $t > 4s$ ,  $0 < t < 4s$ ?

(b) impulse at  $t = 0$  and  $t = 4s$ ?

(ii) Consider one-dimensional motion only.

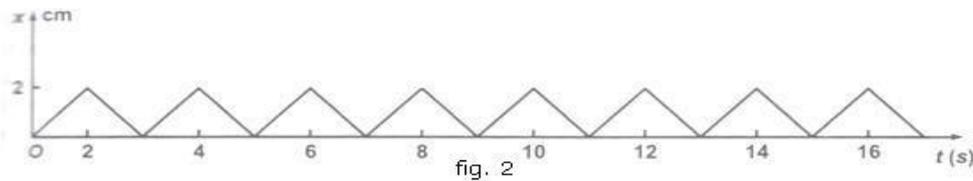

Figure 2 shows the position-time graph of a particle of mass 0.04 kg. Suggest a suitable physical constant for this motion. What is the time between two consecutive impulses received by the particle? What is the magnitude of each impulse? (5)

**OR**

Show that for a particle in linear SHM the average kinetic energy over a period of oscillation equals the average potential energy over the same period. (5)

28. Derive the Bernoulli's equation. (5)

**OR**

Explain the Magnus effect with respect to the motion of a moving ball. What do you understand by 'viscosity'? Give its dimensions and SI unit. On what factors does the coefficient of viscosity of a liquid depend? (5)

29. Explain the following:

- (i) free vibrations
- (ii) damped oscillations
- (iii) maintained oscillations
- (iv) forced oscillation
- (v) resonant or sympathetic vibrations. (5)

**OR**

If the earth were a homogeneous sphere and a straight hole bored in it through its centre. Show that if a body were dropped into the hole, it would execute a simple harmonic motion. Also find its time period. (5)

**CBSE Board**  
**Class XI Physics**  
**Solution**

---

**1.**

Second is the fundamental unit of time and is now defined as the duration of 2,192,631770 vibrations of caesium -133.

**2.**

By lowering his hands, the cricket player increases the interval in which the catch is taken. This increase in time interval results in the lesser rate of change of momentum. Therefore, in accordance with Newton's second law of motion, lesser force acts on his hands and the player saves himself from being hurt.

**3.**

In fact friction is necessary evil. In case friction is not there, we cannot walk, we cannot travel in vehicles, we cannot light a match-stick, etc. Thus friction plays a very important role in our daily life.

**4.**

$$1\text{J} = 10^7 \text{ erg}$$

$$\therefore \frac{\text{SI unit of work}}{\text{CGS unit of work}} = 10^7$$

**5.**

Angular momentum and linear momentum remain constant.

**6.**

Steel is more elastic than rubber, because the inter-atomic bonding strength is more in steel than that of rubber.

7.

Yes, during the change of state (such as melting of ice, boiling of water, etc.) the system absorbs heat but its temperature does not change. In this case, only the internal energy changes.

8.

$$\begin{aligned} PE_{\max} &= \frac{1}{2} m a \omega^2 A^2 \\ &= \frac{1}{2} k A^2, \text{ where } k = m \omega^2 \end{aligned}$$

9.

The tip of the sharp pin is in the range of  $10^{-5}$  to  $10^{-4}$  m. The size of the nucleus is of the order of  $10^{-15}$  to  $10^{-14}$  m. Therefore, when the size of the nucleus is scaled up to the tip, we are scaling by a factor of  $10^{10}$ . Accordingly, the size of the atom will become  $10^{10} \times 10^{-10} = 1$  m.

10.

Let  $2S$  be the total distance covered in time  $t$ ,  
 $S$  in time  $t_1$  and  $S$  in time  $t_2$ , such that  $t = t_1 + t_2$ .

$$\therefore t_1 = \frac{S}{40}, t_2 = \frac{S}{60}$$

$$\begin{aligned} t_1 + t_2 = t &= S \left( \frac{1}{40} + \frac{1}{60} \right) \\ &= S \left( \frac{100}{40 \times 60} \right) \end{aligned}$$

$$\text{or, } \frac{S}{t} = \frac{40 \times 60}{100} = 24 \text{ m s}^{-1}$$

$$\therefore \text{Average speed} = \frac{\text{total distance covered}}{\text{total time taken}} = \frac{2S}{t} = 2 \times 24 = 48 \text{ m s}^{-1}$$

**11.**

The resultant displacement due to 12 m towards east and 5 m towards north (which are at  $90^\circ$  to each other) lies in the plane of paper and is given by.

$$R_1 = \sqrt{(12)^2 + (5)^2} = \sqrt{144 + 25} = 13 \text{ m}$$

Displacement 6 m is vertically upward perpendicular to the plane of paper. Therefore, the angle between  $R_1$  and 6 m is  $90^\circ$ . The resultant of these two (say  $R_2$ ) will be

$$\begin{aligned} R_2 &= \sqrt{(13)^2 + (6)^2} = \sqrt{169 + 36} \\ &= \sqrt{205} = 14.32 \text{ m} \end{aligned}$$

**12.**

- (i) Work done by the centripetal force is always zero.
- (ii) When a person does not move from his position, but he may be holding any amount of load, the work done is zero. Similarly, when a coolie travels on a platform with some load on his head, work done by him is zero.

**13.**

- (a)  $6.67 \times 10^{-11} \text{ Nm}^2\text{kg}^{-2}$
- (b) It is defined as the gravitational force of attraction between two bodies, each of mass 1 kg, separated by a distance of 1 m.

**14.**

(a) Pressure x Volume = Constant

$$\text{Or } PV = \text{Constant}$$

(b) Work done is

$$W = 2.3026 nRT \log_{10}(V_2/V_1)$$

Where  $R$  is the universal gas constant,  $n$  is the number of moles of gas,  $T$  is the absolute temperature,  $V_1$  is the initial volume and  $V_2$  is the final volume of the gas.

**OR**

We know that,  $PV = RT$

We are given  $VP^2 = \text{constant}$

$$\therefore V \left( \frac{RT}{V} \right)^2 = \text{constant}$$

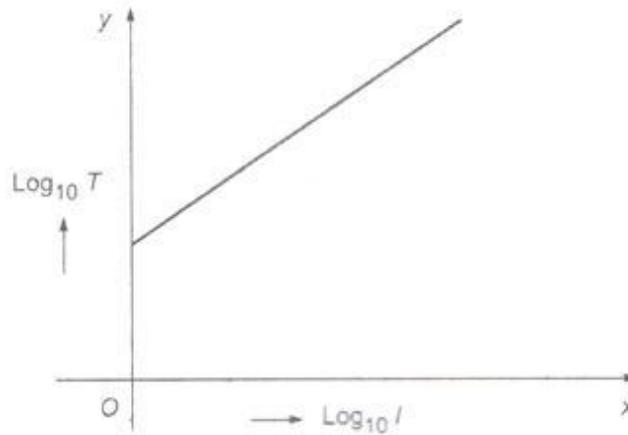

$$\frac{T^2}{V} = \text{constant}$$

$$\text{Using } \frac{T_1^2}{V_1} = \frac{T^2}{V}$$

$$\text{We get, } T_1^2 = 2V \times \frac{T^2}{V} = 2T^2$$

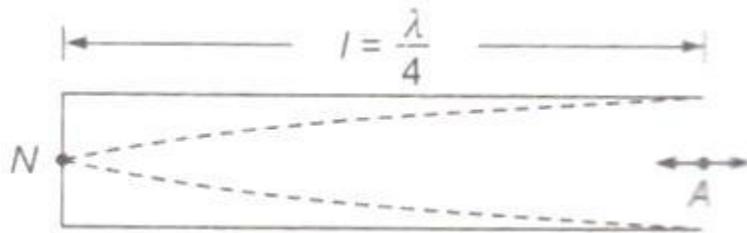

$$T_1 = \sqrt{2}T$$

**15.**

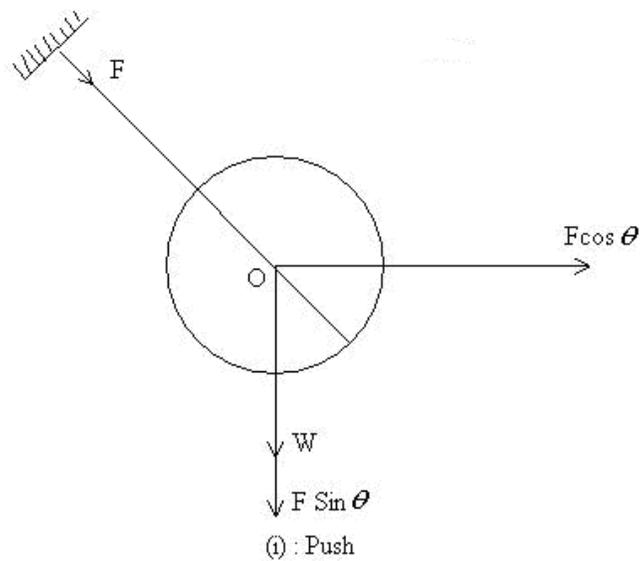

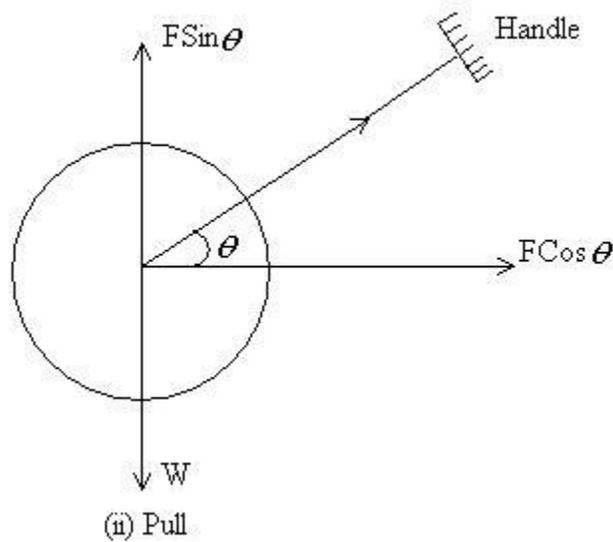

16.

In the case of a closed organ pipe, one of the ends is open and the other is closed. In the case of a closed organ pipe, since one of the ends is open and the other is closed, the amplitude of vibrations of air particles is maximum at the open end and goes on decreasing till there is no vibration at the closed end. Therefore when the air column in a closed organ pipe vibrates in resonance, an antinode is formed at the open end and a node at the closed end.

17.

$W$  is weight of the lawn roller. When pushed by applying a force  $\vec{F}$  at an angle  $\theta$ .  $F \cos \theta$  moves it forward while the apparent weight becomes  $W + F \sin \theta$ .

However when pulled, the apparent weight becomes  $W - F \sin \theta$ .

Since the force of friction is directly proportional to normal reaction (equal to apparent weight of the roller), it is more when it is pushed than when is pulled.

### 18.

Coefficient of restitution: Ratio of relative speed of separation to relative speed of approach.

No, not for each body separately. Total energy and total momentum of the whole isolated system will be conserved.

Heavy water is chosen because collision between fast neutron and near stationary deuterons in heavy water results in maximum exchange of kinetic energy as their masses are comparable.

19.

$$u = 0 ; h = 12 \text{ m.}$$

$$a = g = 9.8 \text{ m s}^{-2}, v = ?$$

$$v^2 = u^2 + 2gh;$$

$$v^2 = 2 \times 9.8 \times 12 \quad \dots\dots\dots(i)$$

$$v^2 = 235.2$$

Kinetic energy of the ball when it just hits the ground

$$= \frac{1}{2} m v^2 = \frac{1}{2} m \times 235.2 \text{ J}$$

Since 25% of K.E is lost on striking, therefore, K.E retained after the impact

$$= \frac{75}{100} \left( \frac{1}{2} m \times 235.2 \right) \text{ J} = \left( \frac{3}{8} m \times 235.2 \right) \text{ J}$$

Let  $v_2$  be the upward velocity just after the collision with the ground, therefore,

$$\text{K.E} = \frac{1}{2} m v_2^2$$

$$= \frac{3}{8} m \times 235.2;$$

$$\text{or} \quad v_2^2 = \frac{3}{4} \times 235.2 \quad \dots\dots\dots(ii)$$

Let  $h'$  be the required height to which the ball bounces, therefore, putting various values we have,

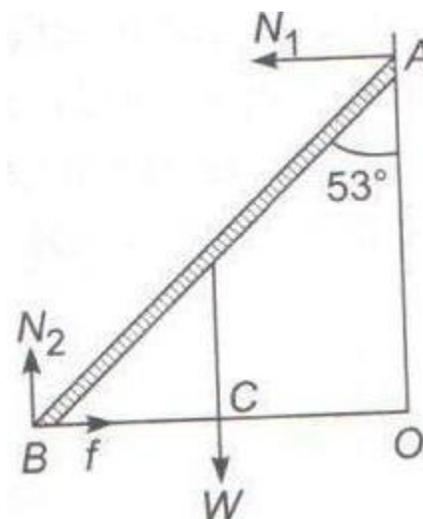

$$v = 0, u = v_2$$

$$h' = ?, v^2 = u^2 + 2gh'$$

$$\text{or} \quad 0 = \frac{3}{4} \times 235.2 + 2(-9.8)h'$$

$$\text{or} \quad h' = \frac{3 \times 235.2}{4 \times 2 \times 9.8} = 9 \text{ m}$$

20.

The forces acting on the ladder are

1. Weight  $W$
2. Normal force  $N_1$  by vertical wall.
3. Normal force  $N_2$  by the floor
4. Frictional force  $F$  by the floor.

Taking horizontal and vertical components, we have

$$N_1 = F$$

$$N_2 = W$$

Taking torque about B, we have

$$N_1 (AO) = W (CB)$$

$$N_1 (AB \cos 53) = W (AB/2) \sin 53$$

$$N_1 = 2/3 W$$

$$N_2 = W = 10 \times 9.8 = 98 \text{ N}$$

$$F = N_1 = 2/3 W = 65 \text{ N}$$

**21.**

(i) It is man-made satellite that remains at a fixed position at a definite height above the surface of the earth. Yes, it is same as a synchronous satellite.

(ii) It is about 36000 km.

(iii) The orbit of the geostationary satellite is called a parking orbit.

**OR**

The change in total energy is

$$E_f - E_i$$

$$E_i = -\frac{GmM}{2(R+h)} = -\frac{GmM}{2(R+R)} = -\frac{GmM}{4R}$$

$$E_f = -\frac{GmM}{2(R+h)} = -\frac{GmM}{2(R+3R)} = -\frac{GmM}{8R}$$

$$\text{change in total energy} = \frac{GmM}{8R} = \frac{gmR}{8} = 3.13 \times 10^9 \text{ J}$$

The kinetic energy of the satellite reduces and it is given by  $-3.13 \times 10^9 \text{ J}$ .

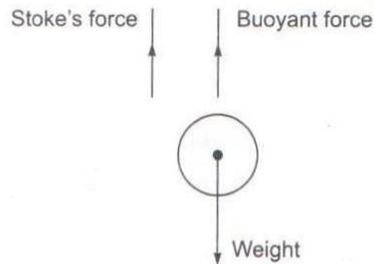

The change in potential energy is twice the change in the total energy so change in potential energy is  $-6.26 \times 10^9 \text{ J}$ .

22.

When a body falls through a viscous fluid, the relative motion produced between the layers of the fluid is opposed by its viscosity and the opposing force increases with the increase in the velocity of the body.

After sometime at a certain stage, the viscous force just balances the driving force (i.e., weight of the body). There onwards, the body moves with a constant velocity, called the terminal velocity.

Let the terminal velocity be  $V$ .

Radius of the ball =  $r$

Coefficient of viscosity =  $\eta$

Density of ball =  $\rho$

Density of fluid =  $\sigma$

$$\text{Weight of ball} = \frac{4}{3} \pi r^3 \rho g$$

$$\text{Buoyant force acting vertically} = \frac{4}{3} \pi r^3 \sigma g$$

$$\therefore \text{Net weight of the ball} = \frac{4}{3} \pi r^3 (\rho - \sigma) g$$

This is equal to the net upward force due to the viscosity =  $6 \pi \eta r v$

$$6 \pi \eta r v = \frac{4}{3} \pi r^3 (\rho - \sigma) g$$

$$v = \frac{2}{9} \frac{r^2 g (\rho - \sigma)}{\eta}$$

23.

(a) No, it is in conformity with the law of conservation of energy.

(b)

(i) There is no indication available as regards the direction in which the change takes place.

(ii) It does not give any idea about the extent to which the change takes place.

**24.**

- (a) Kinetic energy will become four times.
- (b) root mean-square velocity becomes twice.
- (c) pressure is directly proportional to square of r.m.s velocity, hence pressure becomes four times.

**25.**

Pascal's law states that whenever external pressure is applied on any part of a fluid contained in a vessel, it is transmitted undiminished and equally in all directions.

Pressure = atmospheric pressure + pressure due to the water.

$$P = 1.01 \times 10^5 + 10(1000)(10) = 2.01 \times 10^5 \text{ Pa}$$

**26.**

(a) Gita has a caring attitude and concern for others.

(b)

(i) Taking x, y, z-axis as described in the question, the co-ordinates of

Starting point of the mosquito = (0,0,0)

The last point of the mosquito = (7,4,3)

Thus, the displacement of mosquito,  $\mathbf{s} = 7\mathbf{i} + 4\mathbf{j} + 3\mathbf{k}$

Magnitude of displacement =  $\sqrt{74}$

(ii) Also, the x, y, z components are 7, 4 and 3 respectively.

**27.**

(i) Mass of the particle,  $m = 4 \text{ kg}$

(a) Force acting on the particle for the interval  $t < 0$ , is zero as the body is not moving during this interval.

For  $t > 4 \text{ s}$ , the body is again at rest, therefore, no force is acting on the body.

During the interval,  $0 < t < 4 \text{ s}$  shown by OA in the Figure 1, the speed is constant, and hence acceleration is zero. Therefore, no force acts on the body.

(b) Impulse = (final momentum - initial momentum)

Initial momentum just before  $t = 0$  is 0

Final momentum just after  $t = 0$  is  $= 3 \text{ kg ms}^{-1}$

$$(\text{Impulse})_{t=0} = 3 - 0 = 3 \text{ kg ms}^{-1}$$

Similarly,  $(\text{Impulse})_{t=4s} = (\text{final momentum} - \text{initial momentum})$

$$= 0 - 3 = -3 \text{ kg ms}^{-1}$$

(ii) It is clear from the figure that the particle moves between two walls, 2 cm distance after each 2 seconds, and each time rebounds with a constant speed of  $1 \text{ cms}^{-1}$  after each collision.

Impulse = change in momentum

$$= \text{final momentum} - \text{initial momentum}$$

$$= 0.04 \times 2 \times 10^{-2} \text{ kg ms}^{-1}$$

$$= 8 \times 10^{-4} \text{ kgms}^{-1}$$

Thus, the particle receives an impulse of  $8 \times 10^{-4} \text{ kgms}^{-1}$  after every two seconds.

**OR**

The equation of displacement of a particle executing SHM at an instant  $t$  is given as:

$$x = A \sin \omega t$$

Where,  $A$  = Amplitude of oscillation;  $\omega$  = Angular frequency  $\sqrt{\frac{k}{m}}$

The velocity of the particle is:

$$v = \frac{dx}{dt} = A\omega \cos \omega t$$

The kinetic energy of the particle is:

$$E_k = \frac{1}{2} Mv^2 = \frac{1}{2} MA^2 \omega^2 \cos^2 \omega t$$

The potential energy of the particle is:

$$E_p = \frac{1}{2} kx^2 = \frac{1}{2} M\omega^2 A^2 \sin^2 \omega t$$

For time period  $T$ , the average kinetic energy over a single cycle is given as:

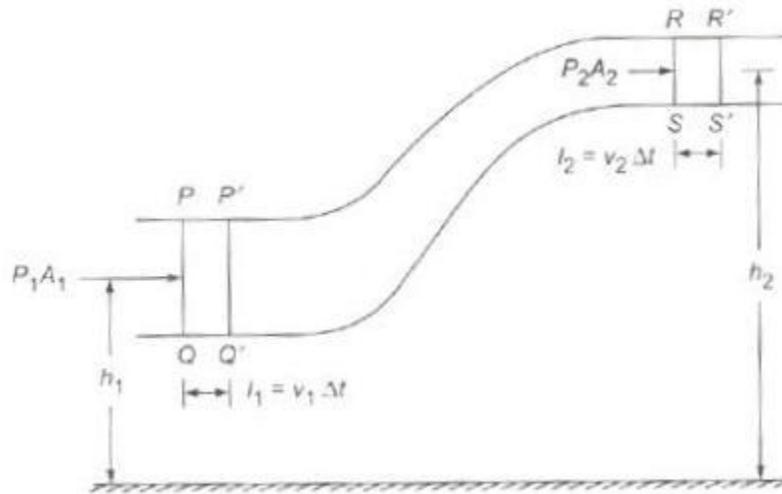

$$\begin{aligned}
(E_k)_{\text{Avg}} &= \frac{1}{T} \int_0^T E_k \, dt \\
&= \frac{1}{T} \int_0^T \frac{1}{2} MA^2 \omega^2 \cos^2 \omega t \, dt \\
&= \frac{1}{2T} MA^2 \omega^2 \int_0^T \frac{(1 + \cos 2\omega t)}{2} \, dt \\
&= \frac{1}{4T} MA^2 \omega^2 \left[ t + \frac{\sin 2\omega t}{2\omega} \right]_0^T \\
&= \frac{1}{4T} MA^2 \omega^2 (T) = \frac{1}{4} MA^2 \omega^2 \quad \dots (i)
\end{aligned}$$

And, average potential energy over one cycle is given as:

$$\begin{aligned}
(E_p)_{\text{Avg}} &= \frac{1}{T} \int_0^T E_p \, dt \\
&= \frac{1}{T} \int_0^T \frac{1}{2} M\omega^2 A^2 \sin^2 \omega t \, dt \\
&= \frac{1}{2T} M\omega^2 A^2 \int_0^T \frac{(1 - \cos 2\omega t)}{2} \, dt \\
&= \frac{1}{4T} M\omega^2 A^2 \left[ t - \frac{\sin 2\omega t}{2\omega} \right]_0^T \\
&= \frac{1}{4T} M\omega^2 A^2 (T) \\
&= \frac{M\omega^2 A^2}{4} \quad \dots (ii)
\end{aligned}$$

It can be inferred from equations (i) and (ii) that the average kinetic energy for a given time period is equal to the average potential energy for the same time period.

28.

Consider a liquid flowing through a non- uniform tube PR. Suppose the velocity of the liquid changes from  $v_1$  at P to  $v_2$  at R.

Take the mass of the liquid element under consideration as m, then,  $m = \text{area of cross-section } \tilde{A} \text{— length } \tilde{A} \text{— density}$

$$= A_1 v_1 \Delta t \rho$$

$$= A_2 v_2 \Delta t \rho$$

Where  $\rho$  is density of the liquid.

Using the equation of continuity, we can write

$$A_1 v_1 = A_2 v_2$$

(i) The gain in kinetic energy is

$$= \frac{1}{2} m v_2^2 - \frac{1}{2} m v_1^2$$

$$= \frac{1}{2} m (v_2^2 - v_1^2)$$

$$= \frac{1}{2} A_1 v_1 \Delta t \rho (v_2^2 - v_1^2) \quad \dots\dots\dots(i)$$

(ii) The gain in potential energy

$$= m g h_2 - m g h_1$$

$$= m g (h_2 - h_1)$$

$$= A_1 v_1 \Delta t \rho g (h_2 - h_1) \quad \dots\dots\dots(ii)$$

(iii) Net work done on the liquid

= Work done on the liquid – work done by the liquid

$$= P_1 A_1 v_1 \Delta t - P_2 A_2 v_2 \Delta t$$

$$= (P_1 - P_2) A_1 v_1 \Delta t$$

$$(\because A_1 v_1 = A_2 v_2)$$

Applying the principle of conservation of energy,

Net work done on the liquid = Gain in K.E + Gain in P.E

$$\therefore (P_1 - P_2) A_1 v_1 \Delta t$$

$$= \frac{1}{2} A_1 v_1 \Delta t \rho (v_2^2 - v_1^2) + A_1 v_1 \Delta t \rho g (h_2 - h_1)$$

$$\text{or } (P_1 - P_2) = \frac{1}{2} (\rho v_2^2 - \rho v_1^2) + \rho g (h_2 - h_1)$$

$$\text{or } P_1 + h_1 \rho g + \frac{1}{2} \rho v_1^2 = P_2 + h_2 \rho g + \frac{1}{2} \rho v_2^2$$

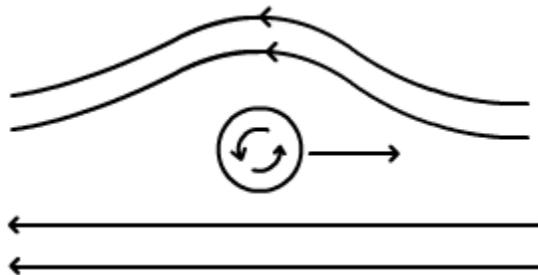

$$\text{or } P + h \rho g + \frac{1}{2} \rho v^2 = \text{constant} \quad \dots\dots\dots(ii)$$

Dividing (iii) by  $\rho g$  we have,

$$\frac{P}{\rho g} + h + \frac{1}{2} \frac{v^2}{g} = \text{constant}$$

This equation is called Bernoulli's equation.

**OR**

**Magnus effect:** If a moving ball is given a spin, the air layers at the top acquire higher velocity than those at the bottom. So, as per Bernoulli's theorem, pressure below the ball becomes greater than that at the top. Due to net upward force, the ball follows a curved path.

Viscosity is a measure of the resistance of a fluid which is being deformed by either shear stress or extensional stress.

Dimension:  $[ML^{-1}T^{-1}]$

SI unit: Poiseulli/decapoise

Depends on: 1. Temperature

2. Nature of liquid

## 29.

(i) They are the free oscillation of a system purely because of certain specific restoring forces (say gravity of a simple pendulum or the mass attached to the spring). The frequency of such a system is called its natural frequency ( $n_o$ ) and the corresponding time period as the natural time period of the oscillating system. Since there are no frictional or viscous forces present, the amplitude of oscillations remains constant. These oscillations are also called undamped vibrations.

(ii) The oscillations in which the amplitude decreases progressively with the time are called damped oscillation.

(iii) When we feed energy back to the oscillations at the same rate at which it is dissipated, then the amplitude of such oscillations would remain constant with time. These oscillations are called maintained or sustained oscillations.

(iv) When an external periodic agent of frequency ( $n$ ) is applied to an oscillator of natural frequency ( $n_o$ ), the external agent is called the driver and the oscillating body is called the driven. The driven oscillator ultimately settles down to the frequency of the driver. Such oscillations that are forced upon the oscillator by the external periodic agent are known as the forced oscillations.

(v) When the frequency of the driver ( $n$ ) approaches the frequency of the driven ( $n_o$ ), then the amplitude of the forced oscillation (and hence power drawn) becomes quite large. The driver and the driven are said to be in resonance. The phenomenon of setting a body into vibration with its natural its natural frequency by another body vibrating with the same frequency is called resonance.

OR

Let a body of mass  $m$  be dropped in a straight hole in the Earth of mass  $M$  and radius  $R$ .

The body will be attracted towards the centre of the Earth with a force given by,

$$F = \frac{GMm}{R^2}$$

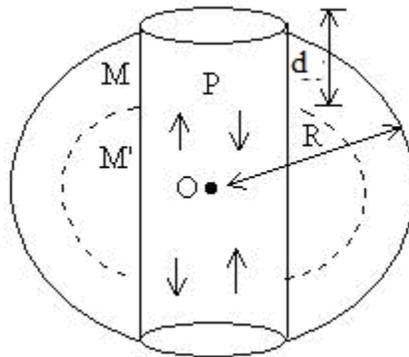

But  $F = mg$

$$\therefore mg = \frac{GMm}{R^2} \quad \text{or} \quad g = \frac{GM}{R^2}$$

$$= \frac{G \frac{4}{3} \pi R^3 \rho}{R^2}$$

$$\text{Or} \quad g = \frac{4\pi GR\rho}{3} \quad (i)$$

Where  $\rho$  is mean density of the Earth.

When the body is dropped into the straight hole and it falls through the depth  $d$ , the value of acceleration due to gravity at the point P is given by,

$$g' = \frac{GM'}{(R-d)^2}$$

Where  $M'$  is the mass of the sphere of radius  $(R-d)$

$$\therefore g' = \frac{4\pi G(R-d)\rho}{3}$$

$$\text{Thus, } g'/g = \frac{(R-d)}{R}$$

$$\text{or} \quad g' = \frac{g}{R} (R-d) \quad \text{or} \quad g' \propto (R-d)$$

i.e., acceleration (in magnitude) of the body is proportional to the displacement from the centre of the earth O. Thus, the motion is *SHM*.

Time period,

$$\begin{aligned} T &= 2\pi \sqrt{\frac{\text{Displacement}}{\text{Acceleration}}} \\ &= 2\pi \sqrt{\frac{(R-d)}{\left[\frac{R-d}{R}\right]g}} = 2\pi \sqrt{\frac{R}{g}} \end{aligned}$$
