

# TYPES OF STRUCTURAL SOMERISM

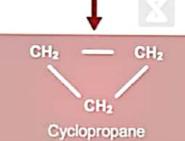

### CHAIN ISOMERISM

Same molecular formula, difference in arrangement. Chain of minimum 4 carbons is necessary.

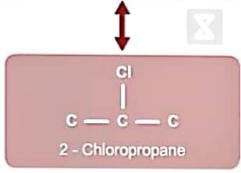

## RING CHAIN ISOMERISM

Mode of chain formation differs in open and close chain formation.

### **POSITION ISOMERISM**

Same molecular formula, difference in the position of either the functional group or the multiple bond or the branched chain.

### **FUNCTIONAL ISOMERISM**

Same molecular formula but different in functional group. Other two functional group Isomers

Alcohol & Ether.

Aldehydes & Ketones.

### **METAMERISM**

Compound having same molecular formula but differ from the nature of alkyl group directly attached with polyvalent atom or polyvalent functional group.

### **TAUTOMERISM**

Compound having same molecular formula but different due to oscillation of an atom (usually H<sup>+</sup>) are known as tautomers.

# GEOMETRICAL ISOMERISM

Isomers which possess the same molecular and structural formula but differ in the arrangement of atoms or groups in space due to restricted rotation are known as geometrical isomers and the phenomenon is known as geometrical isomerism.

#### PRESENCE OF A DOUBLE BOND OR A RING STRUCTURE

-N = N - or ring structure

### DIFFERENT GROUPS SHOULD BE ATTACHED AT EACH DOUBLY BONDED ATOM

### CONFIGURATIONAL NOMENCLATURE IN GEOMETRICAL ISOMERISM

Configuration	Criterla	Remarks
cis / trans	Similarity of groups	If the two similar groups are on same side of restricted bond, the configuration is cis otherwise trans.
E/Z	Seniority of groups	If the two senior groups are on same side of restricted bond, the configuration is Z (Z = zusammen = together) otherwise E (E = entgegen = opposite).

### NUMBER OF GEOMETRICAL ISOMERS

Number of geometrical isomers can be found by calculating the number of stereocentres in the compound. Stereocentre is defined as an atom or bond bearing groups of such nature that an interchange of any two group will produce a stereoisomer.

Nature of compound	No. of G.I. (n = no. of stereocentres)	Example	No. of Isomers
Compound with dissimilar ends	2 <sup>n</sup>	CH₃-CH=CH-CH=CH-C₂H₅	4
Compound with similar ends with even stereocentres	$2^{n+1} + 2^{\frac{n}{2}-1}$	CH₃-CH=CH-CH₃	3
Compound with similar ends with odd stereocentres	$2^{n-1}+2^{\frac{n-1}{2}}$	CH3-CH=CH-CH=CH-CH3	6

Physical properties	Br Br H Br H	Example
Dipole moment	1 > 11	Only cis – isomer has dipole
Boiling point	1 > 11	High boiling point due to larger intermoleculer force of attraction
Solubility (in H <sub>2</sub> O)	1 > 11	Polar molecules are more soluble in H <sub>2</sub> O
Melting point	1 < 11	More symmetric isomers, higher melting points
Stability	1 < 11	More vander waal strain, less stable molecule
