

05

When we come across such equations as $x^2 + 1 = 0$, $x^2 + 9 = 0$, we found ourselves unable to solve these equations, because $x^2 + 1 = 0$ gives $x^2 = -1$ or $x = \pm \sqrt{-1}$, as there is no number in the real number system, whose square is a negative number. Thus, to solve such type of problems, there is another number system called complex number system.

COMPLEX NUMBER

| TOPIC 1 |

Introduction to Complex Numbers

A number consisting of real number and imaginary number is called complex number. A complex number can be defined as a number of the form $a + ib$, where a and b are real numbers, is called a **complex number**.

e.g. $6 + 9i$, $-3 + 4i$ etc., are complex numbers.

Here, the symbol i is used to denote $\sqrt{-1}$ and it is called **iota**.

The complex number is generally denoted by z i.e. $z = a + ib$.

Complex number z can be represented in the form of order pair i.e. z can be represented as (a, b) .

CHAPTER CHECKLIST

- Introduction to Complex Numbers
- Algebra of Complex Numbers
- Conjugate, Modulus and Argand Plane of Complex Number

Knowledge Plus

Euler (1707-43) was the first mathematician, who introduced the symbol i (read as iota) for $\sqrt{-1}$ with property $i^2 + 1 = 0$ i.e. $i^2 = -1$. He also called this symbol as the **imaginary unit**.

REAL AND IMAGINARY PARTS OF A COMPLEX NUMBERS

Let $z = a + ib$ be a complex number, then a is called the **real part** and b is called the **imaginary part** of z and it may be denoted as $\text{Re}(z)$ and $\text{Im}(z)$, respectively.

e.g. If $z = 2 + 3i$, then $\text{Re}(z) = 2$ and $\text{Im}(z) = 3$.

PURELY REAL AND PURELY IMAGINARY COMPLEX NUMBERS

A complex number $z = a + ib$, is called **purely real**, if $b = 0$
i.e. $\text{Im}(z) = 0$ and is called **purely imaginary**, if $a = 0$
i.e. $\text{Re}(z) = 0$.

e.g. $z = 6$ is purely real and $z = 6i$ is purely imaginary.

ZERO COMPLEX NUMBER

A complex number is said to be zero, if its both real and imaginary parts are zero.

In other words, $z = a + ib = 0$, if and only if $a = 0$ and $b = 0$.

SET OF COMPLEX NUMBERS

The product set $R \times R$ consisting of the ordered pair of real number called the **set of real number**. The set of complex numbers is denoted by C and it is defined as

$$C = \{a + ib : a, b \in R\}$$

EXAMPLE |1| Find the real and imaginary parts of the following complex numbers.

$$(i) 7 \quad (ii) 3i$$

Sol. (i) Let $z = 7 = 7 + 0i$

Here, $\text{Re}(z) = 7$ and $\text{Im}(z) = 0$

(ii) Let $z = 3i = 0 + 3i$

Here, $\text{Re}(z) = 0$ and $\text{Im}(z) = 3$

Equality of Complex Numbers

Two complex numbers $z_1 = a + ib$ and $z_2 = c + id$ are said to be equal, if $a = c$ and $b = d$.

EXAMPLE |2| Find the real values of a and b , if

$$(i) (3a - 6) + 2ib = -6b + (6 + a)i$$

$$(ii) (2a + 2b) + i(b - a) = -4i$$

 Equate the real and imaginary parts to get the required result.

Sol. (i) We have, $(3a - 6) + 2ib = -6b + (6 + a)i$

On equating real and imaginary parts, we get

$$3a - 6 = -6b \quad \dots(i)$$

$$\text{and} \quad 2b = 6 + a \quad \dots(ii)$$

Above equations can be rewritten as

$$3a + 6b = 6 \quad \dots(iii)$$

$$\text{and} \quad a - 2b = -6 \quad \dots(iv)$$

On multiplying Eq. (iv) by 3 and then adding with Eq. (iii), we get

$$3a + 6b + 3a - 6b = 6 - 18$$

$$\Rightarrow 6a = -12 \Rightarrow a = -2$$

On substituting $a = -2$ in Eq. (iv), we get

$$-2 - 2b = -6$$

$$\Rightarrow -2b = -6 + 2$$

$$\Rightarrow b = \frac{-4}{-2} = 2$$

$$\therefore a = -2 \text{ and } b = 2$$

(ii) We have, $(2a + 2b) + i(b - a) = -4i$, which can be rewritten as

$$(2a + 2b) + i(b - a) = 0 - 4i$$

On equating real and imaginary parts, we get

$$2a + 2b = 0$$

$$\Rightarrow a + b = 0 \quad [\because 2 \neq 0] \dots(i)$$

$$\text{and} \quad b - a = -4 \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$a + b + b - a = 0 - 4$$

$$\Rightarrow 2b = -4 \Rightarrow b = -2$$

On substituting $b = -2$ in Eq. (i), we get

$$a - 2 = 0 \Rightarrow a = 2 \therefore a = 2 \text{ and } b = -2$$

SOME IMPORTANT RESULT

We already know that, $\sqrt{a} \times \sqrt{b} = \sqrt{ab}$ for all positive real numbers a and b . This result also holds true when either $a > 0, b < 0$ or $a < 0, b > 0$. But above result is not true for $a < 0, b < 0$, which can be explained as follows.

Let us consider, $i^2 = \sqrt{-1}\sqrt{-1} = \sqrt{(-1)(-1)}$

[by assuming $\sqrt{a} \times \sqrt{b} = \sqrt{ab}$ for all real numbers]

$$= \sqrt{1} = 1$$

which is a contradiction to the fact that $i^2 = -1$.

Therefore, $\sqrt{a} \times \sqrt{b} \neq \sqrt{ab}$, if both a and b are negative real numbers.

Note

(i) If a is positive real number, then

$$\sqrt{-a} = \sqrt{a \times (-1)} = \sqrt{a} \times \sqrt{-1} = (\sqrt{a})i$$

(ii) If any of a and b is zero, then, $\sqrt{a} \times \sqrt{b} = \sqrt{ab} = 0$

EXAMPLE |3| Find the value of $\sqrt{-25} + 3\sqrt{-4} + 2\sqrt{-9}$.

Sol. We have, $\sqrt{-25} + 3\sqrt{-4} + 2\sqrt{-9}$

$$= \sqrt{25} \sqrt{-1} + 3\sqrt{4} \sqrt{-1} + 2\sqrt{9} \sqrt{-1}$$

$$= 5 \times i + 3 \times 2 \times i + 2 \times 3 \times i \quad [\because \sqrt{-1} = i]$$

$$= 5i + 6i + 6i = 17i$$

EXAMPLE |4| Write the real and imaginary parts of the complex number $\sqrt{37} + \sqrt{-19}$.

 Write the number $\sqrt{37} + \sqrt{-19}$ in the form $z = a + ib$ and compare, we get $\text{Re}(z) = a$ and $\text{Im}(z) = b$.

Sol. Let $z = \sqrt{37} + \sqrt{-19} = \sqrt{37} + \sqrt{19} \sqrt{-1}$

$$\Rightarrow z = \sqrt{37} + \sqrt{19}i \quad [\because \sqrt{-1} = i]$$

$$\therefore \text{Re}(z) = \sqrt{37} \text{ and } \text{Im}(z) = \sqrt{19}$$

INTEGRAL POWER OF i (IOTA)

I. POSITIVE INTEGRAL POWERS OF i

As we have seen, $i = \sqrt{-1}$. So, we can write the higher powers of i as follows

$$(i) i^2 = -1$$

$$(ii) i^3 = i^2 \cdot i = (-1) \cdot i = -i$$

$$(iii) i^4 = (i^2)^2 = (-1)^2 = 1$$

$$(iv) i^5 = i^{4+1} = i^4 \cdot i = 1 \cdot i = i$$

$$(v) i^6 = i^{4+2} = i^4 \cdot i^2 = 1 \cdot i^2 = -1$$

$$\vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots$$

While evaluating i^n for $n > 4$, we are writing n as $4q+r$ for some $q, r \in N$ and $0 \leq r \leq 3$. So, in order to compute i^n for $n > 4$, write $i^n = i^{4q+r}$ for some $q, r \in N$ and $0 \leq r \leq 3$. Then, $i^n = i^{4q} \cdot i^r = (i^4)^q \cdot i^r = (1)^q \cdot i^r = i^r$

e.g. $i^{17} = i^{4 \times 4 + 1} = i^{4 \times 4} \cdot i = (i^4)^4 \cdot i = 1 \cdot i = i$

i^4 is defined as 1.

Note In general for any integer k , $i^{4k} = 1$, $i^{4k+1} = i$, $i^{4k+2} = -1$ and $i^{4k+3} = -i$

II. NEGATIVE INTEGRAL POWERS OF i

Negative integral powers of i can be evaluated as follows

$$(i) i^{-1} = \frac{1}{i} = \frac{1}{i} \times \frac{i}{i} \quad [\text{multiply numerator and denominator by } i]$$

$$= \frac{i}{i^2} = \frac{i}{(-1)} = -i \quad [i^2 = -1]$$

$$(ii) i^{-2} = \frac{1}{i^2} = \frac{1}{(-1)} = -1$$

$$(iii) i^{-3} = \frac{1}{i^3} = \frac{1}{i^3} \times \frac{i}{i} \quad [\text{multiplying numerator and denominator by } i]$$

$$= \frac{i}{(i^4)} = \frac{i}{(1)} = i$$

$$(iv) i^{-4} = \frac{1}{i^4} = \frac{1}{1} = 1$$

In order to compute i^{-n} for $n > 4$, first write

$i^{-n} = \frac{1}{i^n} = \frac{1}{i^{4q+r}}$ for some $q, r \in N$ and $0 \leq r \leq 3$. Then, evaluate i^{4q+r} . Further, use above four negative integral powers of i .

$$\text{e.g. } i^{-15} = \frac{1}{i^{15}} = \frac{1}{i^{4 \times 3 + 3}} = \frac{1}{i^3} \quad [i^{4q+3} = i^3]$$

$$= \frac{1}{i^3} \times \frac{i}{i} = \frac{i}{i^4} = \frac{i}{1} = i \quad [i^4 = 1]$$

EXAMPLE | 5| Find the value of

$$(i) i^{37} \quad (ii) i^{-30} \quad (iii) \frac{1}{i^7}$$

$$\text{Sol. } (i) \text{ We have, } i^{37} = (i)^{36+1} = (i)^{4 \times 9} i \\ = (i^4)^9 \cdot i = (1)^9 \cdot i = i \quad [i^4 = 1]$$

$$(ii) \text{ We have, } i^{-30} = \frac{1}{i^{30}}$$

$$\text{Now, } i^{30} = (i)^{4 \times 7+2} = (i^{4 \times 7}) i^2 = (i^4)^7 (-1) \quad [i^2 = -1] \\ = (1)^7 (-1) = -1 \quad [i^4 = 1]$$

$$\Rightarrow i^{-30} = \frac{1}{(-1)} = -1$$

$$(iii) \text{ We have, } \frac{1}{i^7} = \frac{1}{(i)^{4+3}} = \frac{1}{i^4 \cdot i^3} \\ = \frac{1}{1 \cdot (-i)} \quad [i^4 = 1 \text{ and } i^3 = -i] \\ = \frac{1}{-i} \times \frac{i}{i} = \frac{i}{-i^2} = \frac{i}{-(-1)} = i \quad [i^2 = -1]$$

EXAMPLE | 6| Express the following in the form of $a + ib$, where $a, b \in R$.

$$(i) i^{103} \quad (ii) (-\sqrt{-1})^{4x+3} \quad (iii) \left(i^{29} + \frac{1}{i^{29}} \right)$$

$$\text{Sol. } (i) i^{103} = i^{25 \times 4 + 3} = (i^4)^{25} \cdot i^3 = (1)^{25} \cdot (-i) \\ = -i = 0 - i \quad [i^4 = 1 \text{ and } i^3 = -i]$$

$$(ii) (-\sqrt{-1})^{4x+3} = (-i)^{4x+3} = (-i)^{4x} \cdot (-i)^3 \\ = i^{4x} (-i^3) = (i^4)^x (-(-i)) \quad [i^3 = -i] \\ = (1)^x (i) \quad [i^4 = 1] \\ = i = 0 + i$$

$$(iii) i^{29} + \frac{1}{i^{29}} = \frac{i^{29} \cdot i^{29} + 1}{i^{29}} = \frac{(i^2)^{29} + 1}{i^{29}} \\ = \frac{(-1)^{29} + 1}{i^{29}} = \frac{-1 + 1}{i^{29}} = 0 = 0 + 0i$$

EXAMPLE | 7| Find the value of $\left[i^{19} + \left(\frac{1}{i} \right)^{25} \right]^2$.

$$\text{Sol. } \left[i^{19} + \left(\frac{1}{i} \right)^{25} \right]^2 = \left[i^{4 \times 4 + 3} + \frac{1}{i^{4 \times 6 + 1}} \right]^2 \\ = \left[(i^4)^4 (i)^3 + \frac{1}{(i^4)^6 i} \right]^2 = \left[(1)^4 (i)^3 + \frac{1}{(1)^6 i} \right]^2 \\ \quad [i^4 = 1 \text{ and } i^3 = -i] \\ = \left(-i + \frac{1}{i} \right)^2 = \left(-i + \frac{i}{i^2} \right)^2 = \left(-i + \frac{i}{i \times i} \right)^2 = \left(-i + \frac{i}{-1} \right)^2 \\ = (-i - i)^2 = (-2i)^2 = 4i^2 = -4 \quad [i^2 = -1]$$

EXAMPLE |8| Show that

$$i^n + i^{n+1} + i^{n+2} + i^{n+3} = 0, \forall n \in N.$$

Sol. LHS = $i^n + i^{n+1} + i^{n+2} + i^{n+3}$

$$\begin{aligned} &= i^n + i^n \cdot i + i^n \cdot i^2 + i^n \cdot i^3 \\ &= i^n(1 + i + i^2 + i^3) \\ &= i^n(1 + i - 1 - i) \quad [\because i^2 = -1, i^3 = i^2 \cdot i = -i] \\ &= i^n(0) = 0 = \text{RHS} \end{aligned}$$

Hence proved.

EXAMPLE |9| Evaluate $\frac{i^{592} + i^{590} + i^{588} + i^{586} + i^{584}}{i^{582} + i^{580} + i^{578} + i^{576} + i^{574}}$.

Sol. Consider the given expression,

$$\begin{aligned} &\frac{i^{592} + i^{590} + i^{588} + i^{586} + i^{584}}{i^{582} + i^{580} + i^{578} + i^{576} + i^{574}} \\ &= \frac{i^{584+8} + i^{584+6} + i^{584+4} + i^{584+2} + i^{584}}{i^{574+8} + i^{574+6} + i^{574+4} + i^{574+2} + i^{574}} \\ &= \frac{i^{584}(i^8 + i^6 + i^4 + i^2 + 1)}{i^{574}(i^8 + i^6 + i^4 + i^2 + 1)} \\ &= \frac{i^{584}}{i^{574}} = i^{584-574} = i^{10} \\ &= i^{4 \times 2 + 2} = (i^4)^2 \cdot i^2 \\ &= (1)^2 \cdot i^2 = -1 \quad [\because i^4 = 1 \text{ and } i^2 = -1] \end{aligned}$$

EXAMPLE |10| What is the value of $\frac{i^{4x+1} - i^{4x-1}}{2}$?

[NCERT Exemplar]

Sol. Consider, $\frac{i^{4x+1} - i^{4x-1}}{2} = \frac{i^{4x} \cdot i - i^{4x} \cdot i^{-1}}{2} = \frac{i - \frac{1}{i}}{2} \quad [\because i^{4x} = 1]$

$$\begin{aligned} &= \frac{i^2 - 1}{2i} = \frac{-2}{2i} \quad [\because i^2 = -1] \\ &= \frac{-1}{i} = \frac{-i}{i^2} \\ &= \frac{-i}{-1} = i \quad [\because i^2 = -1] \end{aligned}$$

EXAMPLE |11| Find the real value of 'a' for which

$3i^3 - 2ai^2 + (1-a)i + 5$ is real. [NCERT Exemplar]

Sol. $3i^3 - 2ai^2 + (1-a)i + 5$

$$\begin{aligned} &= 3(-i) + 2a + (1-a)i + 5 \quad [\because i^3 = -i \text{ and } i^2 = -1] \\ &= (2a+5) + i(1-a-3), \text{ which will be real,} \\ &\text{if} \quad 1-a-3=0, \\ &\text{i.e.} \quad a=-2. \end{aligned}$$

TOPIC PRACTICE 1

OBJECTIVE TYPE QUESTIONS

1 Which of the following options define 'imaginary number'?

- (a) Square root of any number
- (b) Square root of positive number
- (c) Square root of negative number
- (d) Cube root of number

2 Two complex numbers are equal, if and only if

- (a) their real and imaginary parts are separately equal
- (b) their real parts are only equal
- (c) their imaginary parts are only equal
- (d) None of the above

3. If $4x + i(3x - y) = 3 + i(-6)$, where x and y are real numbers, then the values of x and y are

- (a) $x=3, y=4$
- (b) $x=\frac{3}{4}, y=\frac{33}{4}$
- (c) $x=4, y=3$
- (d) $x=33, y=4$

4 Which of the following represent correct form of set of complex numbers?

- (a) $C = \{x + iy : x \in R, y \in R \text{ and } i = \sqrt{-1}\}$
- (b) $C = \{x + iy : x \in R, y \in I\}$
- (c) $C = \{x + iy : x \in I, y \in I\}$
- (d) All of these

5 If $x, y \in R$, then $x + iy$ is a non-real complex number, if

[NCERT Exemplar]

- (a) $x=0$
- (b) $y=0$
- (c) $x \neq 0$
- (d) $y \neq 0$

VERY SHORT ANSWER Type Questions

6 Write the following as complex numbers.

- (i) $\sqrt{-27}$
- (ii) $\sqrt{-16}$
- (iii) $4 - \sqrt{-5}$
- (iv) $-1 - 1\sqrt{-5}$
- (v) $1 + \sqrt{-1}$

7 Write the real and imaginary parts of the complex number.

- (i) $z = \frac{\sqrt{17}}{2} + \frac{2}{\sqrt{70}}i$
- (ii) $\sqrt{37} + \sqrt{-19}$

8 Write the real and imaginary parts of the following complex numbers.

- (i) $2 - i\sqrt{2}$
- (ii) $-\frac{1}{5} + \frac{i}{5}$
- (iii) $\frac{\sqrt{5}}{7}i$
- (iv) $\sqrt{37} + \sqrt{-19}$
- (v) $\sqrt{\frac{37}{3}} + \frac{3}{\sqrt{70}}i$

9 Find a and b such that $2a + 4bi$ and $2i$ represent the same complex number.

10 Find the values of x and y , if

$$x + i(3x - y) = 3 - 6i.$$

11 Write the following as complex numbers.

- | | |
|---|-----------------------------------|
| (i) $5 - 7\sqrt{-21}$ | (ii) $\sqrt{x}; x > 0$ |
| (iii) $\frac{\sqrt{3}}{2} - \frac{\sqrt{-2}}{\sqrt{7}}$ | (iv) $-b + \sqrt{-4ac}; a, c > 0$ |

12 Evaluate $\sqrt{-16} + 3\sqrt{-25} + \sqrt{-36} - \sqrt{-625}$.

13 Express the following in the form of $a + ib$.

- | | |
|--------------------------|--|
| (i) i^{-35} | (ii) i^{998} |
| (iii) $(\sqrt{-1})^{90}$ | (iv) $\left(i^{37} \times \frac{1}{i^{67}}\right)$ |

14 Evaluate $\left[i^{29} + \left(\frac{1}{i}\right)^{50}\right]$.

15 Evaluate the following

- | | |
|---------------------------|--|
| (i) i^{80} | (ii) $\frac{1}{i}$ |
| (iii) $(-\sqrt{-1})^{31}$ | (iv) $\frac{i^2 + i^4 + i^6 + i^7}{1 + i^2 + i^3}$ |

SHORT ANSWER Type Questions

16 Simplify the following.

- | | |
|---|--|
| (i) $2i^2 + 6i^3 + 3i^{16} - 6i^{19} + 4i^{25}$ | (ii) $1 + i^{10} + i^{110} + i^{1000}$ |
| (iii) $i^n + i^{n+1} + i^{n+2} + i^{n+3}$ | (iv) $\left\{i^{17} - \left(\frac{1}{i}\right)^{34}\right\}^2$ |
| (v) $(-i)^{4n+3}$, where n is a positive integer. | |
| (vi) $(2i)^3$ | (vii) i^{-35} |
| (viii) i^{-39} | (ix) $i^9 + i^{19}$ |
| (x) $\left[i^{18} + \left(\frac{1}{i}\right)^{25}\right]^3$ | (xi) $i^6 + i^8$ |
| (xii) $i + i^2 + i^3 + i^4$ | (xiii) $i^{12} + i^{13} + i^{14} + i^{15}$ |
| (xiv) $i^4 + i^8 + i^{12} + i^{16}$ | |

17 Prove that $i^{107} + i^{112} + i^{117} + i^{122} = 0$.

18 Simplify $i^{n+100} + i^{n+50} + i^{n+48} + i^{n+46}$.

19 Explain the fallacy in the following

$$\begin{aligned}-1 &= i \cdot i = \sqrt{-1} \cdot \sqrt{-1} \\ &= \sqrt{(-1)(-1)} = \sqrt{1} = 1\end{aligned}$$

HINTS & ANSWERS

1. (c)

2. (a) Two complex numbers $z_1 = a + ib$ and $z_2 = c + id$ are equal, if $a = c$ and $b = d$ i.e., if their real and imaginary parts are separately equal.

3. (b) We have, $4x + i(3x - y) = 3 + i(-6)$... (i)
Equating the real and the imaginary parts of Eq. (i), we get $4x = 3, 3x - y = -6$

which on solving simultaneously, give $x = \frac{3}{4}$ and $y = \frac{33}{4}$.

4. (a) Set of complex numbers can be represented as
 $C = \{x + iy : x, y \in R \text{ and } i = \sqrt{-1}\}$

5. (d) Given that, $x, y \in R$

Then, $x + iy$ is non-real complex number if and only if $y \neq 0$.

6. (i) $\sqrt{-27} = 3\sqrt{3}\sqrt{-1}$ **Ans.** $0 + i3\sqrt{3}$

(ii) $0 + 4i$

(iii) $4 - \sqrt{-5} = 4 - \sqrt{5}\sqrt{-1}$ **Ans.** $4 - i\sqrt{5}$

(iv) $-1 - i\sqrt{5}$ (v) $1 + i$

7. (i) Let $z = \sqrt{37} + \sqrt{-19}$
Then, $z = \sqrt{37} + \sqrt{19(-1)} = \sqrt{37} + i\sqrt{19}$

Ans. $\operatorname{Re}(z) = 37$ and $\operatorname{Im}(z) = \sqrt{19}$

(ii) $\operatorname{Re}(z) = \frac{\sqrt{17}}{2}$, $\operatorname{Im}(z) = \frac{2}{\sqrt{70}}$

8. (i) $2; -\sqrt{2}$ (ii) $-\frac{1}{5}; \frac{1}{5}$ (iii) $0, \frac{\sqrt{5}}{7}$
(iv) $\sqrt{37}; \sqrt{19}$ (v) $\sqrt{\frac{37}{3}}; \frac{3}{\sqrt{70}}$

9. Given, $2a + i4b = 0 + i2$

$\therefore 2a = 0$ and $4b = 2$ **Ans.** $a = 0$ and $b = \frac{1}{2}$

10. Solve as Example 2. **Ans.** $x = 3$ and $y = 15$

11. (i) $5 - 7\sqrt{-21} = 5 - 7\sqrt{21(-1)}$

Ans. $5 - 7\sqrt{21}i$

(ii) $\sqrt{x} + 0i$ (iii) $\frac{\sqrt{3}}{2} - i\frac{\sqrt{2}}{7}$

(iv) $-b + \sqrt{-4ac} = -b + \sqrt{(4ac)(-1)}$

Ans. $-b + i2\sqrt{ac}$

12. Solve as Example 3. **Ans.** 0

13. (i) $i^{-35} = \frac{1}{i^{35}} = \frac{1}{i^{4 \times 8 + 3}}$ **Ans.** $(0 + i)$

(ii) $i^{998} = i^{4 \times 249 + 2}$ **Ans.** $-1 + 0i$

(iii) $-1 + 0i$

(iv) $-1 + 0i$

14. $i - 1$

15. (i) $i^{80} = (i^4)^{20} = 1^{20}$ Ans. 1

(ii) $-i$ (iii) i

(iv) $\frac{i^2 + i^4 + i^6 + i^7}{1 + i^2 + i^3} = \frac{(-1) + (1) + (-1) + (-i)}{1 + (-1) + (-i)} = \frac{-1 - i}{-i} = \frac{1}{i} + 1$

Ans. $1 - i$

16. (i) $2i^2 + 6i^3 + 3i^{16} - 6i^{19} + 4i^{25}$

$$= 2(-1) + 6(-i) + 3(1) - 6(-i) + 4(i)$$

Ans. $1 + 4i$

(ii) 0

(iii) 0

(iv) $2i$

(v) i

(vi) $8i$

(vii) i

(viii) i

(ix) 0

(x) $2 - 2i$

(xi) 0

(xii) 0

(xiii) 0

(xiv) 4

17. $i^{4 \times 26 + 3} + i^{4 \times 28 + 0} + i^{4 \times 29 + 1} + i^{4 \times 30 + 2}$

$$= (i^4)^{26} \cdot i^3 + (i^4)^{28} \cdot i^0 + (i^4)^{29} \cdot i + (i^4)^{30} \cdot i^2$$

$$= (1)^{26} (-i) + (1)^{28} \cdot 1 + (1)^{29} \cdot i + (1)^{30} \cdot (-1) = 0$$

18. Given expression $= i^{n+100} + i^{n+50} + i^{n+48} + i^{n+46}$

$$= i^n (i^{100} + i^{50} + i^{48} + i^{46}) = i^n (1 - 1 + 1 - 1) = i^n \cdot 0$$

Ans. 0

19. Given, $-1 = i \cdot i = \sqrt{-1} \sqrt{-1} = \sqrt{(-1)(-1)} = \sqrt{1} = 1$

Here, we have $\sqrt{-1} \sqrt{-1} = \sqrt{(-1)(-1)}$

This is not correct as $\sqrt{a} \sqrt{b} = \sqrt{ab}$ if and only if atleast one of a and b is non-negative. Infact,

$$\sqrt{-1} \sqrt{-1} = i \cdot i = i^2 = -1$$

TOPIC 2

Algebra of Complex Numbers

In this section, we shall study how to add, subtract, multiply and divide the complex numbers.

Addition of Two Complex Numbers

Let $z_1 = a_1 + i b_1$ and $z_2 = a_2 + i b_2$ be two complex numbers, then their addition is defined as

$$z = z_1 + z_2 = (a_1 + a_2) + i(b_1 + b_2)$$

e.g. (i) $(5 + 3i) + (-4 - i) = (5 - 4) + i(3 - 1) = 1 + 2i$

(ii) $(2 + 3i) + (-6 + 7i) = (2 - 6) + i(3 + 7) = -4 + 10i$

Note

It can be observed that

(i) Real part of $(z_1 + z_2) = \operatorname{Re}(z_1 + z_2) = \operatorname{Re}(z_1) + \operatorname{Re}(z_2)$

(ii) Imaginary part of $(z_1 + z_2) = \operatorname{Im}(z_1 + z_2) = \operatorname{Im}(z_1) + \operatorname{Im}(z_2)$

PROPERTIES OF ADDITION OF COMPLEX NUMBERS

The addition of complex numbers satisfy the following properties

(i) **Closure Law** If z_1 and z_2 are any two complex numbers, then $z_1 + z_2$ is also a complex number.

(ii) **Commutative Law** If z_1 and z_2 are two complex numbers, then $z_1 + z_2 = z_2 + z_1$.

(iii) **Associative Law** If z_1 , z_2 and z_3 are any three complex numbers, then

$$(z_1 + z_2) + z_3 = z_1 + (z_2 + z_3)$$

(iv) **Existence of Additive Identity** There exists the complex number $0 = 0 + 0i$ called the identity element for addition (or simply additive identity) i.e. $z + 0 = z = 0 + z$ for all $z \in C$.

(v) **Existence of Additive Inverse** For every complex number $z = a + ib$, there exists $-z = (-a) + i(-b)$ such that $z + (-z) = 0 = (-z) + z$.

Here, complex number $(-z)$, is called the additive inverse of z .

e.g. Additive inverse of $z = (-4 + 3i)$ is

$$-z = -(-4 + 3i) = (4 - 3i)$$

Subtraction of Two Complex Numbers

Let $z_1 = a_1 + ib_1$ and $z_2 = a_2 + ib_2$ be two complex numbers. Then, their subtraction $z_1 - z_2$ is defined as the addition of z_1 and $(-z_2)$.

Thus, $z_1 - z_2 = z_1 + (-z_2) = (a_1 + ib_1) + (-a_2 - ib_2)$

$$z_1 - z_2 = (a_1 - a_2) + i(b_1 - b_2)$$

e.g. (i) $(-4 + 7i) - (-11 - 23i) = (-4 + 7i) + (11 + 23i)$

$$= (-4 + 11) + (7 + 23)i = 7 + 30i$$

(ii) $(6 + 5i) - (3 + 2i) = (6 + 5i) + (-3 - 2i)$

$$= (6 - 3) + (5 - 2)i = 3 + 3i$$

Note

It can be observed that

(i) Real part of $(z_1 - z_2) = \operatorname{Re}(z_1 - z_2) = \operatorname{Re}(z_1) - \operatorname{Re}(z_2)$

(ii) Imaginary part of $(z_1 - z_2) = \operatorname{Im}(z_1 - z_2) = \operatorname{Im}(z_1) - \operatorname{Im}(z_2)$

EXAMPLE |1| Express the following in the form of $a + ib$.

(i) $\left[\left(\frac{1}{3} + \frac{7}{3}i \right) + \left(4 + \frac{1}{3}i \right) \right] - \left(-\frac{4}{3} + i \right)$

[NCERT]

(ii) $\left(\frac{1}{2} + \frac{5}{2}i \right) - \frac{3}{2}i + \left(-\frac{5}{2} - i \right)$

Sol. (i) Consider the given expression,

$$\begin{aligned} & \left[\left(\frac{1}{3} + \frac{7}{3}i \right) + \left(4 + \frac{1}{3}i \right) \right] - \left(-\frac{4}{3} + i \right) \\ &= \left[\left(\frac{1}{3} + 4 \right) + i \left(\frac{7}{3} + \frac{1}{3} \right) \right] - \left(-\frac{4}{3} + i \right) \\ &= \left(\frac{13}{3} + \frac{8}{3}i \right) + \left(\frac{4}{3} - i \right) = \left(\frac{13}{3} + \frac{4}{3} \right) + i \left(\frac{8}{3} - 1 \right) \\ &= \frac{17}{3} + \frac{5}{3}i, \text{ which is in the form of } a + ib. \\ & \text{(ii)} \left(\frac{1}{2} + \frac{5}{2}i \right) - \frac{3}{2}i + \left(-\frac{5}{2} - i \right) = \left(\frac{1}{2} - \frac{5}{2} \right) + i \left(\frac{5}{2} - \frac{3}{2} - 1 \right) \\ &= -2 + io, \text{ which is in the form of } a + ib. \end{aligned}$$

Note

For expressing the given expression in standard form i.e. in the form of $a + ib$, just simplify the expression according to the rules of algebra.

EXAMPLE |2| Find the real values of x and y , if

$$(x^4 + 2xi) - (3x^2 + iy) = (3 - 5i) + (1 + 2iy).$$

- (i) Firstly, separate real and imaginary parts of both sides.
- (ii) Second, equate the real and imaginary parts of both sides and get equations in terms of x and y .
- (iii) Further, solve these equations to get the values of x and y .

Sol. We have, $(x^4 + 2xi) - (3x^2 + iy) = (3 - 5i) + (1 + 2iy)$

$$\Rightarrow (x^4 - 3x^2) + (2x - y)i = 4 + (-5 + 2y)i$$

On equating real and imaginary parts both sides, we get

$$x^4 - 3x^2 = 4 \quad \dots (i)$$

$$\text{and} \quad 2x - y = -5 + 2y \Rightarrow 2x - 3y = -5 \quad \dots (ii)$$

On solving Eq. (i), we get

$$x^4 - 3x^2 = 4 \Rightarrow x^4 - 3x^2 - 4 = 0$$

$$\Rightarrow x^4 - 4x^2 + x^2 - 4 = 0$$

$$\Rightarrow (x^2 - 4)(x^2 + 1) = 0 \Rightarrow x^2 - 4 = 0$$

[$\because x^2 + 1 \neq 0$, for any real value of x]

$$\therefore x = \pm 2$$

On putting $x = \pm 2$ in Eq. (ii), we get

$$y = 3, \text{ when } x = 2 \text{ and } y = \frac{1}{3}, \text{ when } x = -2$$

$$\text{Thus, } x = -2, y = \frac{1}{3} \text{ or } x = 2, y = 3.$$

Multiplication of Two Complex Numbers

The product of two complex numbers $z_1 = a + ib$ and $z_2 = c + id$ can be as follow

$$\begin{aligned} z_1 z_2 &= (a + ib)(c + id) = ac + iad + ibc + i^2 bd \\ &= ac + i(ad + bc) + (-1)bd \quad [\because i^2 = -1] \\ z_1 z_2 &= (ac - bd) + i(ad + bc) \end{aligned}$$

e.g. (i) $(2 + 9i)(11 + 3i)$

$$\begin{aligned} &= 2 \times 11 + 2 \times 3i + 11 \times 9i + 9 \times 3i^2 \\ &= 22 + 6i + 99i - 27 = -5 + 105i \quad [\because i^2 = -1] \end{aligned}$$

(ii) $(-5 + 7i)(-13 - 3i)$

$$\begin{aligned} &= (-5)(-13) + (-5)(-3i) + (7i)(-13) + (7i)(-3i) \\ &= 65 + 15i - 91i - 21i^2 = 65 - 76i + 21 \quad [\because i^2 = -1] \\ &= 86 - 76i \end{aligned}$$

(iii) $(5i)\left(\frac{-3}{5}i\right) = \left[5 \times \left(\frac{-3}{5}\right)\right](i \times i)$

$$= (-3)(i^2) = -3 \times -1 = 3$$

PROPERTIES OF MULTIPLICATION OF COMPLEX NUMBERS

(i) **Closure Law** If z_1 and z_2 are any two complex numbers, then $z_1 z_2$ is also a complex number.

(ii) **Commutative Law** If z_1 and z_2 are any two complex numbers, then $z_1 z_2 = z_2 z_1$.

(iii) **Associative Law** If z_1 , z_2 and z_3 are any three complex numbers, then $(z_1 z_2) z_3 = z_1 (z_2 z_3)$.

(iv) **Existence of Multiplicative Identity** There exists the complex number $1 = 1 + 0 \cdot i$ is the identity element for multiplication i.e. for every complex number z , we have $z \cdot 1 = 1 \cdot z = z$.

(v) **Existence of Multiplicative Inverse (or Reciprocal)**

Corresponding to every non-zero complex number $z = a + ib$, there exists a complex number $z_1 = x + iy$ such that $z \cdot z_1 = 1 = z_1 \cdot z$, where $x = \frac{a}{a^2 + b^2}$ and $y = \frac{-b}{a^2 + b^2}$.

Then, z_1 is called multiplicative inverse of z and it is denoted by $\frac{1}{z}$ or z^{-1} . We also called z_1 , the reciprocal of z .

e.g. Let $z = 3 - 7i$. Then, $a = 3, b = -7$

Its multiplicative inverse,

$$\begin{aligned} z^{-1} &= \left[\frac{3}{(3)^2 + (-7)^2} \right] + i \left[\frac{-(-7)}{(3)^2 + (-7)^2} \right] \\ &= \left(\frac{3}{9+49} \right) + i \left(\frac{7}{9+49} \right) = \frac{3}{58} + \frac{7i}{58} \end{aligned}$$

(vi) **Distributive Law** If z_1 , z_2 and z_3 are any three complex numbers.

Then, $z_1(z_2 + z_3) = z_1 z_2 + z_1 z_3$ [left distributive law]

and $(z_1 + z_2)z_3 = z_1 z_3 + z_2 z_3$

[right distributive law]

EXAMPLE |3| If z_1 and z_2 are complex numbers, then prove that $\operatorname{Re}(z_1 z_2) = \operatorname{Re}(z_1) \operatorname{Re}(z_2) - \operatorname{Im}(z_1) \operatorname{Im}(z_2)$.
[NCERT]

Sol. Let $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$

$$\text{Then, } z_1 z_2 = (x_1 x_2 - y_1 y_2) + i(x_1 y_2 + y_1 x_2)$$

$$\therefore \operatorname{Re}(z_1 z_2) = x_1 x_2 - y_1 y_2 \\ = \operatorname{Re}(z_1) \operatorname{Re}(z_2) - \operatorname{Im}(z_1) \operatorname{Im}(z_2)$$

Hence proved.

EXAMPLE |4| Express the following in the form $a + ib$

$$(i) (-i)(3i) \left(-\frac{1}{6}i\right)^3 \quad (ii) (-\sqrt{3} + \sqrt{-2})(-2 + \sqrt{-3})$$

$$\begin{aligned} \text{Sol. } (i) \quad & (-i)(3i) \left(-\frac{1}{6}i\right)^3 = (-3i^2) \left(-\frac{1}{216}i^3\right) \\ & = (-3 \times (-1)) \left(-\frac{1}{216}(-i)\right) \quad [\because i^2 = -1 \text{ and } i^3 = -i] \\ & = 3 \times \frac{1}{216} \times i = \frac{i}{72} = 0 + \frac{1}{72}i \end{aligned}$$

which is in the form of $a + ib$.

$$\begin{aligned} (ii) \quad & (-\sqrt{3} + \sqrt{-2})(-2 + \sqrt{-3}) \\ & = (-\sqrt{3} + i\sqrt{2})(-2 + i\sqrt{3}) \\ & \quad [\because \sqrt{-2} = \sqrt{2} \times \sqrt{-1} = \sqrt{2}i, \text{ similarly } \sqrt{-3} = \sqrt{3}i] \\ & = 2\sqrt{3} - 3i - 2\sqrt{2}i + i^2\sqrt{6} \\ & = 2\sqrt{3} - i(3 + 2\sqrt{2}) - \sqrt{6} \quad [\because i^2 = -1] \\ & = (2\sqrt{3} - \sqrt{6}) - i(3 + 2\sqrt{2}) \end{aligned}$$

which is in the form of $a + ib$.

EXAMPLE |5| Find the real values of x and y , if $(1+i)(x+iy) = 2-5i$.

Sol. We have, $(1+i)(x+iy) = 2-5i$

$$\begin{aligned} \Rightarrow \quad & x+iy+ix+i^2y = 2-5i \\ \Rightarrow \quad & x+i(y+x)-y = 2-5i \quad [\because i^2 = -1] \\ \Rightarrow \quad & (x-y)+i(x+y) = 2-5i \end{aligned}$$

On equating real and imaginary parts from both sides, we get

$$x-y=2 \quad \dots(i)$$

$$\text{and} \quad x+y=-5 \quad \dots(ii)$$

On adding Eqs. (i) and (ii), we get

$$x-y+x+y=2-5 \Rightarrow 2x=-3 \Rightarrow x=\frac{-3}{2}$$

On substituting $x=\frac{-3}{2}$ in Eq. (ii), we get

$$\frac{-3}{2}+y=-5 \Rightarrow y=-5+\frac{3}{2}=\frac{-10+3}{2}=\frac{-7}{2}$$

$$\therefore x=\frac{-3}{2} \text{ and } y=\frac{-7}{2}$$

IDENTITIES RELATED TO COMPLEX NUMBERS

Identity is an equation which is true for all values of the variable (complex number) involved in it. Here, we have the following identities.

$$(i) (z_1 + z_2)^2 = z_1^2 + z_2^2 + 2z_1 z_2,$$

for all complex numbers z_1 and z_2 .

$$(ii) (z_1 - z_2)^2 = z_1^2 - 2z_1 z_2 + z_2^2$$

$$(iii) (z_1 + z_2)^3 = z_1^3 + 3z_1^2 z_2 + 3z_1 z_2^2 + z_2^3$$

$$(iv) (z_1 - z_2)^3 = z_1^3 - 3z_1^2 z_2 + 3z_1 z_2^2 - z_2^3$$

$$(v) z_1^2 - z_2^2 = (z_1 + z_2)(z_1 - z_2)$$

Proof (i) We have, $(z_1 + z_2)^2 = (z_1 + z_2)(z_1 + z_2)$

$$= (z_1 + z_2)z_1 + (z_1 + z_2)z_2$$

[assume first bracket as one term and then apply distributive law]

$$= z_1^2 + z_2 z_1 + z_1 z_2 + z_2^2 \quad [\text{by distributive law}]$$

$$= z_1^2 + z_1 z_2 + z_1 z_2 + z_2^2$$

[by commutative law of multiplication]

$$= z_1^2 + 2z_1 z_2 + z_2^2$$

Similarly, we can prove the other identities.

Note

Many other identities which are true for all real numbers, can be true for all complex numbers.

EXAMPLE |6| Simplify each of the following and put it in the form $a + ib$.

$$(i) (2 + \sqrt{-3})^2 \quad (ii) \left(\frac{1}{3} + 3i\right)^3 \quad [NCERT]$$

$$(iii) (3 + \sqrt{-5})(3 - \sqrt{-5})$$

$$\begin{aligned} \text{Sol. } (i) \quad & (2 + \sqrt{-3})^2 = (2 + \sqrt{3}i)^2 \\ & = 2^2 + 2 \cdot (2)(\sqrt{3}i) + (\sqrt{3}i)^2 \end{aligned}$$

$$[\because (z_1 + z_2)^2 = z_1^2 + 2z_1 z_2 + z_2^2]$$

$$= 4 + 4\sqrt{3}i + 3i^2 = 4 + 4\sqrt{3}i - 3$$

$$= 1 + 4\sqrt{3}i \quad [\because i = -1]$$

$$(ii) \left(\frac{1}{3} + 3i\right)^3 = \left(\frac{1}{3}\right)^3 + 3\left(\frac{1}{3}\right)^2 (3i) + 3\left(\frac{1}{3}\right)(3i)^2 + (3i)^3$$

$$[\because (z_1 + z_2)^3 = z_1^3 + 3z_1^2 z_2 + 3z_1 z_2^2 + z_2^3]$$

$$= \frac{1}{27} + 3\left(\frac{1}{9}\right)(3i) + 3\left(\frac{1}{3}\right)(9i^2) + 27i^3$$

$$= \frac{1}{27} + i + 9(-1) + 27(-i) \quad [\because i^2 = -1 \text{ and } i^3 = -i]$$

$$= \frac{1}{27} - 9 - 26i = \frac{1 - 243}{27} - 26i = \frac{-242}{27} - 26i$$

$$\begin{aligned}
 \text{(iii)} \quad & (3 + \sqrt{-5})(3 - \sqrt{-5}) = (3 + \sqrt{5}i)(3 - \sqrt{5}i) \\
 & = (3)^2 - (\sqrt{5}i)^2 \quad [\because (z_1 - z_2)(z_1 + z_2) = z_1^2 - z_2^2] \\
 & = 9 - 5i^2 = 9 + 5 = 14 \quad [\because i^2 = -1]
 \end{aligned}$$

EXAMPLE |7| Express $(1 - i)^4$ in the form $a + ib$.

[NCERT]

$$\begin{aligned}
 \text{Sol.} \quad & (1 - i)^4 = ((1 - i)^2)^2 = ((1)^2 - 2(1)(i) + (i)^2)^2 \\
 & \quad [\because (z_1 - z_2)^2 = z_1^2 - 2z_1z_2 + z_2^2] \\
 & = (1 - 2i - 1)^2 \quad [\because i^2 = -1] \\
 & = (-2i)^2 = 4i^2 = -4 = -4 + 0i
 \end{aligned}$$

which is in the form of $a + ib$.

EXAMPLE |8| Evaluate $\left[i^{18} + \left(\frac{1}{i}\right)^{25}\right]^3$. [NCERT]

$$\begin{aligned}
 \text{Sol.} \quad & \left[i^{18} + \left(\frac{1}{i}\right)^{25}\right]^3 = \left[i^{4 \times 4 + 2} + \left(\frac{i}{i^2}\right)^{25}\right]^3 \\
 & = \left[\left(i^4\right)^4 \cdot i^2 + \left(\frac{i}{-1}\right)^{25}\right]^3 \quad [\because i^2 = -1] \\
 & = \left[1 \cdot (-1) + \frac{i^{25}}{(-1)}\right]^3 \quad [\because i^4 = 1 \text{ and } i^2 = -1] \\
 & = [-1 - i^{4 \times 6 + 1}]^3 \\
 & = [-1 - (i^4)^6 \cdot i]^3 = [-1 - i]^3 \quad [\because i^4 = 1] \\
 & = -[1 + i]^3 = -(1 + 3i + 3i^2 + i^3) \\
 & \quad [\because (z_1 + z_2)^3 = (z_1^3 + 3z_1^2z_2 + 3z_1z_2^2 + z_2^3)] \\
 & = -(1 + 3i - 3 - i) \quad [\because i^2 = -1 \text{ and } i^3 = -i] \\
 & = -(-2 + 2i) = 2 - 2i = 2(1 - i)
 \end{aligned}$$

EXAMPLE |9| Evaluate $(1 + i)^6 + (1 - i)^3$.

Sol. We have, $(1 + i)^6 = ((1 + i)^2)^3$ [NCERT Exemplar]

$$\begin{aligned}
 & = (1 + i^2 + 2i)^3 \\
 & \quad [\because (z_1 + z_2)^2 = z_1^2 + z_2^2 + 2z_1z_2] \\
 & = (1 - 1 + 2i)^3 \quad [\because i^2 = -1] \\
 \Rightarrow \quad & (1 + i)^6 = (2i)^3 = 8i^3 = -8i \quad [\because i^3 = -1] \dots \text{(i)} \\
 \text{and} \quad & (1 - i)^3 = 1^3 - i^3 - 3(1)^2i + 3(1)(i)^2 \\
 & \quad [\because (z_1 - z_2)^3 = z_1^3 - 3z_1^2z_2 + 3z_1z_2^2 - z_2^3] \\
 & = 1 - (-i) - 3i - 3 \quad [\because i^3 = -i \text{ and } i^2 = -1] \\
 \Rightarrow \quad & (1 - i)^3 = -2 - 2i \quad \dots \text{(ii)}
 \end{aligned}$$

On adding Eqs. (i) and (ii), we get

$$(1 + i)^6 + (1 - i)^3 = -8i - 2 - 2i = -2 - 10i$$

EXAMPLE |10| Find the values of x and y , if

$$(3x - 2iy)(2 + i)^2 = 10(1 + i).$$

Sol. We have, $(3x - 2iy)(2 + i)^2 = 10(1 + i)$

$$\begin{aligned}
 \Rightarrow \quad & (3x - 2iy)(4 + i^2 + 4i) = 10 + 10i \\
 & [\because (z_1 + z_2)^2 = z_1^2 + z_2^2 + 2z_1z_2] \\
 \Rightarrow \quad & (3x - 2iy)(4 - 1 + 4i) = 10 + 10i \quad [\because i^2 = -1] \\
 \Rightarrow \quad & (3x - 2iy)(3 + 4i) = 10 + 10i \\
 \Rightarrow \quad & (9x + 8y) + i(12x - 6y) = 10 + 10i
 \end{aligned}$$

On equating real and imaginary parts of both sides, we get

$$9x + 8y = 10 \quad \dots \text{(i)}$$

$$\text{and} \quad 12x - 6y = 10 \quad \dots \text{(ii)}$$

On multiplying Eq. (i) by 6 and Eq. (ii) by 8, then adding the result, we get

$$54x + 48y + 96x - 48y = 60 + 80$$

$$\Rightarrow \quad 150x = 140 \Rightarrow x = \frac{14}{15}$$

On substituting $x = \frac{14}{15}$ in Eq. (i), we get

$$9 \times \frac{14}{15} + 8y = 10 \Rightarrow \frac{42}{5} + 8y = 10$$

$$\Rightarrow \quad 8y = 10 - \frac{42}{5} \Rightarrow 8y = \frac{8}{5} \Rightarrow y = \frac{1}{5}$$

$$\therefore \quad x = \frac{14}{15} \text{ and } y = \frac{1}{5}$$

EXAMPLE |11| If $(x + iy)^{1/3} = a + ib$, where

$$x, y, a, b \in R, \text{ then show that } \frac{x}{a} - \frac{y}{b} = -2(a^2 + b^2). \quad \text{[NCERT Exemplar]}$$

 Firstly, use identity $(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3$ and then equate the coefficients of real and imaginary parts.

Sol. We have, $(x + iy)^{1/3} = a + ib$

$$\begin{aligned}
 \Rightarrow \quad & x + iy = (a + ib)^3 \quad [\text{cubing both sides}] \\
 \Rightarrow \quad & x + iy = a^3 + i^3b^3 + 3a^2bi + 3ab^2i^2 \\
 & \quad [\because (z_1 + z_2)^3 = z_1^3 + z_2^3 + 3z_1^2z_2 + 3z_1z_2^2] \\
 \Rightarrow \quad & x + iy = a^3 - ib^3 + i3a^2b - 3ab^2 \\
 & \quad [\because i^3 = -i \text{ and } i^2 = -1]
 \end{aligned}$$

$$\Rightarrow \quad x + iy = a^3 - 3ab^2 + i(3a^2b - b^3)$$

On equating real and imaginary parts from both sides, we get

$$x = a^3 - 3ab^2 \text{ and } y = 3a^2b - b^3$$

$$\Rightarrow \quad \frac{x}{a} = a^2 - 3b^2 \text{ and } \frac{y}{b} = 3a^2 - b^2$$

$$\text{Now, } \frac{x}{a} - \frac{y}{b} = a^2 - 3b^2 - 3a^2 + b^2$$

$$= -2a^2 - 2b^2 = -2(a^2 + b^2)$$

EXAMPLE |12| Find the value of $2x^4 + 5x^3 + 7x^2 - x + 41$, when $x = -2 - \sqrt{3}i$.

Sol. We have, $x = -2 - \sqrt{3}i$ [NCERT Exemplar]
 $\Rightarrow x + 2 = -\sqrt{3}i$

On squaring both sides, we get

$$(x + 2)^2 = (-\sqrt{3}i)^2 \Rightarrow x^2 + 4 + 4x = 3i^2$$

$$[\because (z_1 + z_2)^2 = z_1^2 + z_2^2 + 2z_1z_2]$$

$$\Rightarrow x^2 + 4x + 4 = -3$$

$$[\because i^2 = -1]$$

$$\Rightarrow x^2 + 4x + 7 = 0$$

Now divide $2x^4 + 5x^3 + 7x^2 - x + 41$ by $x^2 + 4x + 7$.

$$\begin{array}{r} 2x^2 - 3x + 5 \\ x^2 + 4x + 7) 2x^4 + 5x^3 + 7x^2 - x + 41 \\ 2x^4 + 8x^3 + 14x^2 \\ \hline -3x^3 - 7x^2 - x + 41 \\ -3x^3 - 12x^2 - 21x \\ \hline + + + \\ 5x^2 + 20x + 41 \\ 5x^2 + 20x + 35 \\ \hline 6 \end{array}$$

Thus, $2x^4 + 5x^3 + 7x^2 - x + 41$
 $= (x^2 + 4x + 7)(2x^2 - 3x + 5) + 6$
 $[\because \text{dividend} = \text{quotient} \times \text{divisor} + \text{remainder}]$
 $= 0 \times (2x^2 - 3x + 5) + 6 = 6 \quad [\because x^2 + 4x + 7 = 0]$

Division of Two Complex Numbers

The division of a complex number z_1 by a non-zero complex number z_2 is defined as the multiplication of z_1 by the multiplicative inverse of z_2 and is denoted by $\frac{z_1}{z_2}$.

Therefore, $\frac{z_1}{z_2} = z_1 \cdot z_2^{-1} = z_1 \cdot \left(\frac{1}{z_2}\right)$

Note

Order relations "greater than" and "less than" are not defined for complex numbers.

METHOD FOR EXPRESSING DIVISION OF COMPLEX NUMBERS IN THE STANDARD FORM

Step I Simplify the numerator and denominator separately and convert it in the form of $\frac{a+ib}{c+id}$.

Step II On rationalising the denominator of the result obtained in step I, i.e. multiply the numerator and denominator by $c-id$.

Step III Simplify and write it in the $x+iy$ form.

EXAMPLE |13| Express $(-2 - 5i) \div (3 - 6i)$ in the form $a+ib$.

Sol. $(-2 - 5i) \div (3 - 6i) = \frac{-2 - 5i}{3 - 6i}$
 $= \frac{-(2 + 5i)}{3 - 6i} \times \frac{(3 + 6i)}{(3 + 6i)}$
 $\quad \quad \quad [\text{by rationalising the denominator}]$
 $= -\frac{[6 + 12i + 15i + 30i^2]}{(3)^2 - (6i)^2} \quad [\because (z_1 + z_2)(z_1 - z_2) = z_1^2 - z_2^2]$
 $= -\frac{[6 + 27i - 30]}{9 + 36} \quad [\because i^2 = -1]$
 $= -\frac{(-24 + 27i)}{45} = \frac{24}{45} - \frac{27}{45}i$
 $= \frac{8}{15} - \frac{3}{5}i = \frac{8}{5} + i\left(\frac{-3}{5}\right), \text{ which is in the form of } (a+ib).$

EXAMPLE |14| Express $\frac{(3 + \sqrt{5}i)(3 - \sqrt{5}i)}{(\sqrt{3} + \sqrt{2}i) - (\sqrt{3} - \sqrt{2}i)}$ in the form of $a+ib$. [NCERT]

Sol. Write the complex number in the form $\frac{a+ib}{c+id}$ and then rationalising the denominator. Further simplify it.

$\frac{(3 + \sqrt{5}i)(3 - \sqrt{5}i)}{(\sqrt{3} + \sqrt{2}i) - (\sqrt{3} - \sqrt{2}i)}$
 $= \frac{(3)^2 - (\sqrt{5}i)^2}{\sqrt{3} + \sqrt{2}i - \sqrt{3} + \sqrt{2}i} \quad [\because (z_1 + z_2)(z_1 - z_2) = z_1^2 - z_2^2]$
 $= \frac{9 + 5}{2\sqrt{2}i} = \frac{14}{2\sqrt{2}i} = \frac{7}{\sqrt{2}i} \times \frac{\sqrt{2}i}{\sqrt{2}i} \quad [\text{by rationalising the denominator}]$
 $= \frac{7\sqrt{2}i}{2i^2} = \frac{7\sqrt{2}i}{-2} = 0 - i\frac{7\sqrt{2}}{2}$
 $= 0 + i\left(\frac{-7\sqrt{2}}{2}\right), \text{ which is in the form of } (a+ib).$

EXAMPLE |15| Reduce $\left(\frac{1}{1-4i} - \frac{2}{1+i}\right)\left(\frac{3-4i}{5+i}\right)$ to the standard form. [NCERT]

Sol. $\left(\frac{1}{1-4i} - \frac{2}{1+i}\right)\left(\frac{3-4i}{5+i}\right)$
 $= \left[\frac{1+i-2(1-4i)}{(1-4i)(1+i)}\right]\left(\frac{3-4i}{5+i}\right)$
 $= \left(\frac{1+i-2+8i}{1+i-4i-4i^2}\right)\left(\frac{3-4i}{5+i}\right)$
 $= \left(\frac{-1+9i}{1-3i+4}\right)\left(\frac{3-4i}{5+i}\right) \quad [\because i^2 = -1]$

$$\begin{aligned}
&= \left(\frac{-1+9i}{5-3i} \right) \left(\frac{3-4i}{5+i} \right) = \frac{-3+4i+27i-36i^2}{25+5i-15i-3i^2} \\
&= \frac{-3+31i+36}{25-10i+3} = \frac{33+31i}{28-10i} \quad [\because i^2 = -1] \\
&= \frac{(33+31i)}{(28-10i)} \times \frac{(28+10i)}{(28+10i)} \\
&\quad [\text{by rationalising the denominator}] \\
&= \frac{924+868i+330i+310i^2}{784-100i^2} \\
&= \frac{924+1198i-310}{784+100} \\
&= \frac{614+1198i}{884} = \frac{307}{442} + \frac{599i}{442}
\end{aligned}$$

EXAMPLE | 16 Express $\left(\frac{4i^3 - 1}{2i + 1} \right)^2$ in the form of $a + ib$, where $a, b \in \mathbb{R}$.

$$\begin{aligned}
\text{Sol} \quad &\left(\frac{4i^3 - 1}{2i + 1} \right)^2 = \left[\frac{4(-i) - 1}{2i + 1} \right]^2 \quad [\because i^3 = -i] \\
&= \left(\frac{-4i - 1}{2i + 1} \right)^2 = \frac{(1+4i)^2}{(1+2i)^2} = \frac{1+16i^2+8i}{1+4i^2+4i} \\
&\quad [\because (z_1 + z_2)^2 = z_1^2 + z_2^2 + 2z_1z_2] \\
&= \frac{1-16+8i}{1-4+4i} = \frac{-15+8i}{-3+4i} \quad [\because i^2 = -1] \\
&= \frac{15-8i}{3-4i} = \frac{15-8i}{3-4i} \times \frac{3+4i}{3+4i} \\
&\quad [\text{by rationalising the denominator}] \\
&= \frac{(15-8i)(3+4i)}{9^2-16i^2} \quad [\because (z_1 - z_2)(z_1 + z_2) = z_1^2 - z_2^2] \\
&= \frac{(15-8i)(3+4i)}{9-16i^2} = \frac{45+60i-24i-32i^2}{9+16} \\
&= \frac{45+36i+32}{25} = \frac{77+36i}{25} = \frac{77}{25} + \frac{36}{25}i
\end{aligned}$$

which is in the form of $(a + ib)$.

EXAMPLE | 17 If $a + ib = \frac{x+i}{x-i}$, where x is real, then

prove that $a^2 + b^2 = 1$ and $\frac{b}{a} = \frac{2x}{x^2 - 1}$. [NCERT]

$$\begin{aligned}
\text{Sol} \quad &\text{We have, } a + ib = \frac{x+i}{x-i} = \frac{x+i}{x-i} \times \frac{x+i}{x+i} \\
&\quad [\text{by rationalising the denominator}] \\
&= \frac{x^2 + 2xi + i^2}{x^2 - i^2} = \frac{x^2 - 1 + 2xi}{x^2 + 1} \quad [\because i^2 = -1]
\end{aligned}$$

$$\Rightarrow a + ib = \frac{x^2 - 1}{x^2 + 1} + \frac{2x}{x^2 + 1}i$$

On comparing real and imaginary parts both sides, we get

$$a = \frac{x^2 - 1}{x^2 + 1} \text{ and } b = \frac{2x}{x^2 + 1} \quad \dots(i)$$

$$\begin{aligned}
\text{Now, } a^2 + b^2 &= \left(\frac{x^2 - 1}{x^2 + 1} \right)^2 + \left(\frac{2x}{x^2 + 1} \right)^2 \quad [\text{from Eq. (i)}] \\
&= \frac{(x^2 - 1)^2 + 4x^2}{(x^2 + 1)^2} = \frac{x^4 + 1 - 2x^2 + 4x^2}{(x^2 + 1)^2} \\
&= \frac{x^4 + 1 + 2x^2}{(x^2 + 1)^2} = \frac{(x^2 + 1)^2}{(x^2 + 1)^2} = 1
\end{aligned}$$

$$\begin{aligned}
\text{Also, } \frac{b}{a} &= \frac{\frac{2x}{x^2 + 1}}{\frac{x^2 - 1}{x^2 + 1}} = \frac{2x}{x^2 - 1} \quad [\text{from Eq. (i)}]
\end{aligned}$$

Hence proved.

EXAMPLE | 18 If $\left(\frac{1+i}{1-i} \right)^3 - \left(\frac{1-i}{1+i} \right)^3 = x + iy$, then find (x, y) . [NCERT Exemplar]

$$\begin{aligned}
\text{Sol} \quad &\text{Consider, } \frac{1+i}{1-i} = \frac{1+i}{1-i} \times \frac{1+i}{1+i} \\
&\quad [\text{by rationalising the denominator}] \\
&= \frac{(1+i)^2}{1-i^2} = \frac{1+i^2+2i}{1+1} \\
&\Rightarrow \frac{1+i}{1-i} = \frac{1-1+2i}{2} = i \quad [\because i^2 = -1] \dots(i) \\
&\text{Now, } \frac{1-i}{1+i} = \frac{1}{\left(\frac{1+i}{1-i} \right)} = \frac{1}{i} \quad [\text{from Eq. (i)}] \\
&= \frac{1}{i} \times \frac{i}{i} = \frac{i}{i^2} = \frac{i}{(-1)} = -i \quad [\because i^2 = -1] \dots(ii)
\end{aligned}$$

$$\begin{aligned}
\text{Hence, } &\left(\frac{1+i}{1-i} \right)^3 - \left(\frac{1-i}{1+i} \right)^3 = i^3 - (-i)^3 \\
&= i^3 + i^3 = 2i^3 = 2(-i) = 0 - 2i \quad [\because i^3 = -i]
\end{aligned}$$

$$\therefore x + iy = 0 - 2i$$

On comparing real and imaginary parts both sides, we get

$$x = 0 \text{ and } y = -2$$

$$\therefore (x, y) = (0, -2)$$

TOPIC PRACTICE 2

OBJECTIVE TYPE QUESTIONS

- 1** If z is a complex number and $z + (-z) = 0$, then
 (a) $(-z)$ is called additive inverse of z
 (b) $-z$ is additive identity of z
 (c) $-z$ is closure of z
 (d) $-z$ is commutative of z
- 2** If z is non-zero complex number and $z = a + ib$, then inverse of z is
 (a) $\frac{a}{a^2 + b^2} + \frac{-bi}{a^2 + b^2}$ (b) $\frac{a}{a^2 - b^2} + \frac{-bi}{a^2 - b^2}$
 (c) $\frac{a}{a^2 - b^2} + \frac{ib}{a^2 - b^2}$ (d) $\frac{-a}{a^2 + b^2} + \frac{-bi}{a^2 + b^2}$
- 3** If $z_1 = 6 + 3i$ and $z_2 = 2 - i$, then $\frac{z_1}{z_2}$ is equal to
 (a) $\frac{1}{5}(9+12i)$ (b) $9+12i$
 (c) $3+2i$ (d) $\frac{1}{5}(12+9i)$
- 4** If $z = i^{-39}$, then simplest form of z is equal to
 (a) $1+0i$ (b) $0+i$ (c) $0+0i$ (d) $1+i$
- 5** If $(x-iy)^{1/3} = a+ib$, where $x, y, a, b \in \mathbb{R}$ then the value of $\frac{x}{a} + \frac{y}{b}$ is equal to
 (a) $4(a^2 - b^2)$ (b) $4(a^2 + b^2)$
 (c) $2(a^2 - b^2)$ (d) $2(a^2 + b^2)$

VERY SHORT ANSWER Type Questions

- 6** Express the following in the form $a + ib$.
 (i) $\left(\frac{1}{5} + \frac{2}{5}i\right) - \left(4 + i\frac{5}{2}\right)$ [NCERT]
 (ii) $3(1-2i) - (-4-5i) + (-8+3i)$
- 7** Find the real values of x and y for which $(1+i)y^2 + (6+i) = (2+i)x$.
- 8** Find the sum of the complex numbers $-\sqrt{3} + \sqrt{-2}$ and $2\sqrt{3} - i$.
- 9** Express $(-\sqrt{3} + \sqrt{-2})(2\sqrt{3} - i)$ in the form of $a + ib$.
- 10** Find the real values of x and y for which $(x+iy)(2-3i) = 4+i$.
- 11** Express $(\sqrt{6} + 5i)\left(\sqrt{6} - \frac{1}{5}i\right)$ in the form of $a + ib$.
- 12** Express $(7+5i)(7-5i)$ in the form of $a + ib$.

- 13** Express the following in the form of $a + ib$.

- (i) $(7-i2) - (4+i) + (-3+i5)$
 (ii) $\left[\left(\frac{1}{3} + i\frac{7}{3}\right) + \left(4+i\frac{1}{3}\right)\right] - \left(-\frac{4}{3} + i\right)$
 (iii) $i^3 + (6+3i) - (20+5i) + (14+3i)$
 (iv) $(7+i5)(7-i5)$ (v) $3i^3(15i^6)$
 (vi) $\sqrt{3} + (\sqrt{3}-i2) - (3-2i)$

SHORT ANSWER Type Questions

- 14** Express $\frac{5+\sqrt{2}i}{1-\sqrt{2}i}$ in the form $a + ib$.
- 15** Evaluate $\frac{(1-i)^3}{1-i^3}$. [NCERT Exemplar]
- 16** If $\left(\frac{1-i}{1+i}\right)^{100} = a+ib$, then find (a, b) .
- 17** If $\frac{(1+i)^2}{2-i} = x+iy$, then find the value of $x+y$.
- 18** Express $\left[\left(\sqrt{5} + \frac{i}{2}\right)(\sqrt{5} - 2i)\right] + (6+5i)$ in the form $a + ib$.
- 19** If $x+iy = \frac{a+i}{a-i}$, then prove that $ay-1=x$.
- 20** Express $(5-3i)^3$ in the form $a + ib$. [NCERT]
- 21** Express the following in the form $a + ib$.
 (i) $(1+i)^4$ (ii) $\left(\frac{1}{2} + i2\right)^3$
 (iii) $\left(-2-i\frac{1}{3}\right)^3$ (iv) $\left(\frac{1}{3} + 3i\right)^3$
 (v) $(5-3i)^3$ (vi) $(1-i)^4$
- 22** What is the smallest positive integer n , for which $(1+i)^{2n} = (1-i)^{2n}$?
- 23** If $z_1, z_2 \in \mathbb{C}$, prove that $\operatorname{Im}(z_1 \cdot z_2) = \operatorname{Re}(z_1) \cdot \operatorname{Im}(z_2) + \operatorname{Im}(z_1) \cdot \operatorname{Re}(z_2)$.
- 24** Find x and y , if $(3x-2iy)(2+i)^2 = 10(1+i)$.
- 25** Find the real values of x and y , if $\frac{x-1}{3+i} + \frac{y-1}{3-i} = i$.
- 26** Find the following as a single complex number $x + iy$.
 (i) $\frac{(3+i\sqrt{5})(3-i\sqrt{5})}{(\sqrt{3}+i\sqrt{2}) - (\sqrt{3}-i\sqrt{2})}$
 (ii) $\left(\frac{1}{1-4i} - \frac{2}{1+i}\right) \left(\frac{3-4i}{5+i}\right)$

LONG ANSWER Type Questions

27 Find the values of x and y , if

$$\frac{(1+i)x - 2i}{3+i} + \frac{(2-3i)y + i}{3-i} = i.$$

28 If $x = \sqrt{-2} - 1$, then find the value of $x^4 + 4x^3 + 6x^2 + 4x + 9$.

29 If $x = 3 + 4i$, then find the value of $x^4 - 12x^3 + 70x^2 - 204x + 225$.

30 If $x = 3 + 2i$, then find the value of $x^4 - 4x^3 + 4x^2 + 8x + 39$.

31 If $x = -5 + 2\sqrt{-4}$, find the value of $x^4 + 9x^3 + 35x^2 - x + 4$.

32 Evaluate $2x^3 + 2x^2 - 7x + 72$, when $x = \frac{3 - 5i}{2}$.

HINTS & ANSWERS

1. (a)

2. (a) Given, $z = a + ib$. Let multiplicative inverse of z is z^{-1} .

$$\text{Then, } z^{-1} = \frac{1}{z} = \frac{1}{a+ib} = \frac{a-ib}{(a+ib)(a-ib)}$$

[multiplying numerator and denominator by $(a - ib)$]

$$= \frac{a-ib}{a^2+b^2}$$

$$z^{-1} = \frac{a}{a^2+b^2} - i \frac{b}{a^2+b^2}$$

3. (a) We have,

$$z_1 = 6 + 3i \text{ and } z_2 = 2 - i$$

$$\therefore \frac{z_1}{z_2} = (6+3i) \frac{1}{2-i} = \frac{(6+3i)(2+i)}{(2-i)(2+i)}$$

$$= (6+3i) \left(\frac{2}{5} + i \frac{1}{5} \right)$$

$$= (6+3i) \frac{(2+i)}{5}$$

$$= \frac{1}{5}(9+12i)$$

4. (b) $i^{-39} = \frac{1}{i^{39}}$

Multiplying and dividing by i , we get

$$\begin{aligned} &= \frac{i}{i^{40}} = \frac{i}{(i^4)^{10}} = \frac{i}{(1)^{10}} = \frac{i}{1} = i \quad (\because i^4 = 1) \\ &= 0 + i \end{aligned}$$

5. (a) We have $(x - iy)^{1/3} = a + ib$

$$\Rightarrow x - iy = (a + ib)^3$$

$$\Rightarrow x - iy = a^3 + i^3 b^3 + 3abi(a + ib)$$

$$\Rightarrow x - iy = a^3 - b^3 i + 3a^2 bi - 3ab^2$$

$$\Rightarrow x = a^3 - 3ab^2 \text{ and } y = 3a^2 b - b^3$$

$$\Rightarrow \frac{x}{a} = a^2 - 3b^2 \text{ and } \frac{y}{b} = 3a^2 - b^2$$

$$\therefore \frac{x}{a} + \frac{y}{b} = a^2 - 3b^2 + 3a^2 - b^2 = 4(a^2 - b^2)$$

$$\mathbf{6.} \quad \mathbf{(i)} \quad \mathbf{-}\frac{19}{5}-\frac{21}{10}i \quad \mathbf{(ii)} \quad \mathbf{-1+2i}$$

$$\mathbf{7.} \quad y^2 + iy^2 + 6 + i = 2x + ix \Rightarrow y^2 + 6 = 2x \text{ and } y^2 + 1 = x$$

Ans. $(x = 5, y = 2)$ or $(x = 5, y = -2)$

$$\mathbf{8.} \quad (-\sqrt{3} + \sqrt{-2}) + (2\sqrt{3} - i) = -\sqrt{3} + \sqrt{2}i + 2\sqrt{3} - i$$

Ans. $\sqrt{3} + (\sqrt{2} - 1)i$

$$\mathbf{9.} \quad (-6 + \sqrt{2}) + i(\sqrt{3} + 2\sqrt{6})$$

$$\mathbf{10.} \quad x = \frac{5}{13} \text{ and } y = \frac{14}{13}$$

$$\mathbf{11.} \quad 7 + \frac{24\sqrt{6}}{5}i$$

12. Use the identity $(z_1 + z_2)(z_1 - z_2) = z_1^2 - z_2^2$ **Ans.** $74 + 0i$

$$\mathbf{13.} \quad \mathbf{(i)} \quad 0 + 2i \quad \mathbf{(ii)} \quad \frac{17}{3} + \frac{5}{3}i \quad \mathbf{(iii)} \quad 0 + 0i \quad \mathbf{(iv)} \quad 74 + 0i$$

$$(v) \quad 0 + 45i \quad (vi) \quad (2\sqrt{3} - 3) + 0i$$

14. Multiply numerator and denominator by $1 + \sqrt{2}i$, we get

$$\frac{5 + \sqrt{2}i}{1 - \sqrt{2}i} \times \frac{1 + \sqrt{2}i}{1 + \sqrt{2}i} = \frac{3 + 6\sqrt{2}i}{1 + 2} \quad \mathbf{Ans.} \quad 1 + 2\sqrt{2}i$$

$$\mathbf{15.} \quad \frac{(1-i)^3}{1-i^3} = \frac{1^3 - i^3 - 3i + 3i^2}{1+i} = \frac{1+i-3i-3}{1+i} = \frac{-2-2i}{1+i}$$

Ans. -2

$$\mathbf{16.} \quad \left(\frac{1-i}{1+i} \right)^{100} = \left(\frac{1-i}{1+i} \times \frac{1-i}{1-i} \right)^{100}$$

$$= \left(\frac{1^2 + i^2 - 2i}{1+1} \right)^{100} = \left(\frac{1-1-2i}{2} \right)^{100} = (-i)^{100} = 1$$

Ans. $(1, 0)$

$$\mathbf{17.} \quad \frac{(1+i)^2}{2-i} = \frac{1+i^2+2i}{2-i} = \frac{2i}{2-i} \times \frac{2+i}{2+i} = \frac{4i-2}{4+1} \quad \mathbf{Ans.} \quad \frac{2}{5}$$

$$\mathbf{18.} \quad \frac{\left(\sqrt{5} + \frac{i}{2}\right)(\sqrt{5} - 2i)}{6+5i} = \frac{5+1+\left(\frac{\sqrt{5}}{2} - 2\sqrt{5}\right)i}{6+5i}$$

$$= \frac{6 - \frac{3\sqrt{5}i}{2}}{(6+5i)} \times \frac{6-5i}{6-5i} = \frac{36 - \frac{15\sqrt{5}}{2} + \left(\frac{-18\sqrt{5}}{2} - 30\right)i}{36+25}$$

$$\mathbf{Ans.} \quad \frac{72-15\sqrt{5}}{122} - i\left(\frac{30+9\sqrt{5}}{61}\right)$$

19. $\frac{a+i}{a-i} \times \frac{a+i}{a+i} = \frac{a^2 - 1 + 2ai}{a^2 + 1}$

20. $(5-3i)^3 = 5^3 - (3i)^3 - 3 \times 5^2 \times 3i + 3 \times 5 \times (3i)^2$
 $= 125 + 27i - 225i - 135$

Ans. $-10 - 198i$

21. (i) $(1+i)^4 = (1+i)^2(1+i)^2$

$$= (1-1+2i)(1-1+2i) = (2i)(2i)$$

Ans. $-4 + 0i$

(ii) $\left(\frac{1}{2} + 2i\right)^3 = \left(\frac{1}{2}\right)^3 + (2i)^3 + 3\left(\frac{1}{2}\right)^2 (2i) + 3\left(\frac{1}{2}\right)(2i)^2$
 $= \frac{1}{8} - 8i + \frac{3i}{2} - 6$

Ans. $-\frac{47}{8} - \frac{13}{2}i$

(iii) $-\frac{22}{3} - \frac{107}{27}i$ (iv) $-\frac{242}{27} - 26i$

(v) $-10 - 198i$ (vi) $-4 + 0i$

22. Write the given expression as $\left(\frac{1+i}{1-i}\right)^{2n} = 1$ Ans. $n = 2$

23. Now, $z_1 z_2 = (a_1 + ib_1)(a_2 + ib_2)$

$$\Rightarrow z_1 z_2 = a_1 a_2 - b_1 b_2 + (b_1 a_2 + a_1 b_2)i$$

$$\therefore \operatorname{Im}(z_1 z_2) = a_1 b_2 + b_1 a_2 = \operatorname{Re}(z_1) \operatorname{Im}(z_2) + \operatorname{Re}(z_2) \operatorname{Im}(z_1)$$

24. Given, $(3x - 2iy)(2+i)^2 = 10(1+i)$

$$\Rightarrow (3x - 2iy)(4 + 4i + i^2) = 10 + 10i$$

$$\Rightarrow (9x - 6yi + 12xi - 8i^2y) = 10 + 10i$$

$$\therefore 9x + 8y = 10 \text{ and } 12x - 6y = 10$$

Ans. $x = \frac{14}{15}, y = \frac{1}{5}$

25. $\frac{(x-1)(3-i)+(y-1)(3+i)}{(3+i)(3-i)} = i$

$$\Rightarrow \frac{(3x+3y-6)+i(y-x)}{9-i^2} = i \text{ Ans. } x = -4, y = 6$$

26. (i) $\frac{(3+i\sqrt{5})(3-i\sqrt{5})}{(\sqrt{3}+i\sqrt{2})-(\sqrt{3}-i\sqrt{2})} = \frac{9+5}{2i\sqrt{2}} = \frac{14}{2\sqrt{2}} \times \frac{i}{i^2} = \frac{-14i}{2\sqrt{2}}$

Ans. $-\frac{7\sqrt{2}}{2}i$

(ii) $\left(\frac{1}{1-4i} - \frac{2}{1+i}\right)\left(\frac{3-4i}{5+i}\right)$

$$= \frac{(-1+9i)(3-4i)}{(5-3i)(5+i)} = \frac{33+31i}{28-10i} \times \frac{28+10i}{28+10i}$$

$$= \frac{614+1198i}{784+100} = \frac{614+1198i}{884} \text{ Ans. } \frac{307}{442} + \frac{599}{442}i$$

27. Given, $\frac{(1+i)x - 2i}{3+i} + \frac{(2-3i)y + i}{3-i} = i$

$$\Rightarrow \frac{x+(x-2)i}{3+i} + \frac{2y+(1-3y)i}{3-i} = i$$

$$\Rightarrow \frac{[x+(x-2)i](3-i) + [2y+(1-3y)i](3+i)}{(3+i)(3-i)} = i$$

$$\Rightarrow (4x+9y-3) + i(2x-7y-3) = 10i$$

$$\Rightarrow 4x+9y-3 = 0 \text{ and } 2x-7y-3 = 10.$$

Ans. $x = 3$ and $y = -1$

28. $x+1 = \sqrt{2}i \Rightarrow x^2 + 1 + 2x = -2 \Rightarrow x^2 + 2x + 3 = 0$

Further, solve as Example 12. Ans. 12

29. $x-3=4i \Rightarrow x^2 + 9 - 6x = -16 \Rightarrow x^2 - 6x + 25 = 0$

Further, solve as Example 12. Ans. 0

30. 0 31. -160 32. 4

TOPIC 3

Conjugate, Modulus and Argand Plane of Complex Number

Conjugate of a Complex Number

A pair of complex numbers z_1 and z_2 is said to be conjugate of each other, if the sum and product of two z_1 and z_2 both are real.

Let $z_1 = a + ib$ and $z_2 = a - ib$

Sum of z_1 and $z_2 = (a+ib) + (a-ib) = 2a$ (real)

Product of z_1 and $z_2 = (a+ib)(a-ib)$

$$= a^2 - i^2b^2 [\because (x+y)(x-y) = x^2 - y^2]$$

$$= a^2 + b^2 \text{ (real)} \quad [\because i^2 = -1]$$

Hence, z_1 and z_2 are conjugate to each other.

The conjugate of a complex number z , is the complex number, obtained by changing the sign of imaginary part of z . It is denoted by \bar{z} .

e.g. If $z = 2+3i$, then $\bar{z} = 2-3i$
 and if $z = -4-3i$, then $\bar{z} = -4+3i$

Note

(i) A pair of complex numbers z_1 and z_2 is said to be conjugate of each other, if $\bar{z}_1 = z_2$ and $\bar{z}_2 = z_1$.

(ii) Conjugate of purely real complex number is same.
 i.e. if $z = 3$, then $\bar{z} = 3$

EXAMPLE |1| Find the conjugate of complex number $3 + i$.

Sol. Let $z = 3 + i$

$$\therefore z = 3 + i$$

[since, the conjugate of complex number z , is the complex number, obtained by changing the sign of imaginary part of z]

EXAMPLE |2| Simplify the following complex number.

$$\overline{9-i} + \overline{6+i^3} - \overline{9+i^2}$$

Firstly, write each complex number in standard form and then find its conjugate.

$$\text{Sol. } \overline{9-i} + \overline{6+i^3} - \overline{9+i^2}$$

$$\begin{aligned} &= (9+i) + \overline{6-i} - \overline{9-1} \quad [\because i^3 = -i \text{ and } i^2 = -1] \\ &= (9+i) + (6+i) - \overline{8} \\ &= 15 + 2i - 8 = 7 + 2i \end{aligned}$$

EXAMPLE |3| Find the real and imaginary parts of the conjugate of the complex number $-5i^{-15} - 6i^{-8}$.

 Firstly, write the given complex number in the form of $a + ib$ and find its conjugate. Further, compare the real and imaginary parts of both sides to get the result.

Sol. Let $z = -5i^{-15} - 6i^{-8}$

$$\begin{aligned} &= \frac{-5}{i^{15}} - \frac{6}{i^8} = \frac{-5}{(i^4)^3 \cdot i^3} - \frac{6}{(i^4)^2} \quad [\because i^{15} = i^{4 \times 3 + 3}] \\ &= \frac{-5}{(1)^3 \cdot (-i)} - \frac{6}{(1)^2} \quad [\because i^4 = 1 \text{ and } i^3 = -i] \\ &= \frac{-5}{-i} - 6 = \frac{5}{i} - 6 = \frac{5-6i}{i} = \frac{(5-6i)i}{i \cdot i} \\ &\quad \text{[by rationalising the denominator]} \\ &= \frac{5i-6i^2}{i^2} = \frac{5i+6}{-1} = -6-5i \quad [\because i^2 = -1] \\ \therefore \bar{z} &= -6+5i \end{aligned}$$

Hence, $\text{Re}(\bar{z}) = -6$ and $\text{Im}(\bar{z}) = 5$

EXAMPLE |4| Find the real numbers x and y , if $(x - iy)(3 + 5i)$ is the conjugate of $-6 - 24i$.

 Firstly, simplify the product of two complex numbers in the form of $a + ib$ and equate it to the conjugate of $-6 - 24i$ i.e. $-6 + 24i$. Further, equate real and imaginary parts of both sides and solve the equations to get the values of x and y .

Sol. We have, $(x - iy)(3 + 5i)$ is the conjugate of $-6 - 24i$.

$$\begin{aligned} &\Rightarrow (x - iy)(3 + 5i) = -6 + 24i \quad [\because \text{conjugate of } -6 - 24i = -6 + 24i] \\ &\Rightarrow 3x - 3iy + 5ix - 5i^2y = -6 + 24i \\ &\Rightarrow (3x + 5y) + i(5x - 3y) = -6 + 24i \quad [\because i^2 = -1] \dots (\text{i}) \end{aligned}$$

On equating real and imaginary parts both sides of Eq. (i), we get

$$3x + 5y = -6 \quad \dots (\text{ii})$$

$$\text{and} \quad 5x - 3y = 24 \quad \dots (\text{iii})$$

On multiplying Eq. (i) by 3 and Eq. (ii) by 5, then adding the result, we get

$$9x + 15y + 25x - 15y = -18 + 120 \Rightarrow 34x = 102 \Rightarrow x = 3$$

On substituting $x = 3$ in Eq. (i), we get

$$9 + 5y = -6 \Rightarrow 5y = -15 \Rightarrow y = -3$$

Hence, the required values of x and y are respectively 3 and -3 .

EXAMPLE |5| Let $z_1 = 2 - i$ and $z_2 = -2 + i$, then find

$$\text{Re}\left(\frac{z_1 z_2}{\bar{z}_1}\right). \quad \text{[NCERT]}$$

Sol. We have, $z_1 = 2 - i$ and $z_2 = -2 + i$

$$\begin{aligned} \text{Now, } \frac{z_1 z_2}{\bar{z}_1} &= \frac{(2-i)(-2+i)}{(2-i)} = \frac{-(2-i)(2-i)}{2+i} \\ &= -\frac{(4+i^2-4i)}{2+i} = -\frac{(4-1-4i)}{2+i} = -\frac{(3-4i)}{2+i} \times \frac{2-i}{2-i} \\ &\quad \text{[by rationalising the denominator]} \\ &= -\frac{(6-3i-8i+4i^2)}{4-i^2} = -\frac{(6-11i-4)}{4} = -\frac{(6-11i-4)}{5} \quad [\because i^2 = -1] \\ &= -\frac{2-11i}{5} = \frac{-2}{5} + \frac{11}{5}i \therefore \text{Re}\left(\frac{z_1 z_2}{\bar{z}_1}\right) = \text{Re}\left(\frac{-2}{5} + \frac{11}{5}i\right) = \frac{-2}{5} \end{aligned}$$

EXAMPLE |6| What is the conjugate of $\frac{2-i}{(1-2i)^2}$?

[NCERT Exemplar]

 Firstly, write the given complex number in the standard form and then find its conjugate.

$$\text{Sol. Let } z = \frac{2-i}{(1-2i)^2} = \frac{2-i}{(1^2 - 2(1)(2i) + (2i)^2)}$$

$$[\because (z_1 - z_2)^2 = z_1^2 - 2z_1 z_2 + z_2^2]$$

$$\Rightarrow z = \frac{2-i}{(1-4i-4)} \quad [\because i^2 = -1]$$

$$\Rightarrow z = \frac{2-i}{-3-4i} \Rightarrow z = \frac{2-i}{-3-4i} \times \frac{-3+4i}{-3+4i}$$

[by rationalising the denominator]

$$\Rightarrow z = \frac{(2-i)(-3+4i)}{(-3)^2 - (4i)^2} \quad [\because (z_1 + z_2)(z_1 - z_2) = z_1^2 - z_2^2]$$

$$\Rightarrow z = \frac{-6+8i+3i-4i^2}{9-16i^2} \Rightarrow z = \frac{-6+11i+4}{9+16} \quad [\because i^2 = -1]$$

$$\Rightarrow z = \frac{-2+11i}{25} \Rightarrow z = -\frac{2}{25} + \frac{11}{25}i$$

$$\text{Hence, } \bar{z} = -\frac{2}{25} - \frac{11}{25}i$$

EXAMPLE |7| Solve the equation $z^2 = \bar{z}$, where $z = x + iy$. [NCERT Exemplar]

Sol. We have, $z^2 = \bar{z} \Rightarrow (x + iy)^2 = x - iy$

$$\Rightarrow x^2 + (iy)^2 + 2xyi = x - iy$$

$$[\because (z_1 + z_2)^2 = z_1^2 + z_2^2 + 2z_1z_2]$$

$$\Rightarrow x^2 - y^2 + 2xyi = x - iy \quad [\because i^2 = -1]$$

On equating real and imaginary parts, we get

$$x^2 - y^2 = x \quad \dots(i)$$

and $2xy = -y \quad \dots(ii)$

From Eq. (ii), we have

$$2xy + y = 0 \Rightarrow y(2x + 1) = 0$$

$$\Rightarrow y = 0 \text{ or } x = -\frac{1}{2}$$

Case I When $y = 0$.

In this case, we have $x^2 = x$ [from Eq. (i)]

$$\Rightarrow x^2 - x = 0 \Rightarrow x(x - 1) = 0 \Rightarrow x = 0 \text{ or } x = 1$$

$$\therefore z = 0 + 0i \text{ or } z = 1 + 0i$$

Case II When $x = -\frac{1}{2}$.

In this case, we have

$$\frac{1}{4} - y^2 = -\frac{1}{2} \quad \text{[from Eq. (i)]}$$

$$\Rightarrow y^2 = \frac{1}{4} + \frac{1}{2} = \frac{3}{4} \Rightarrow y = \pm \frac{\sqrt{3}}{2}$$

$$\therefore z = -\frac{1}{2} \pm i \frac{\sqrt{3}}{2}$$

Hence, the solutions of given equation are $0 + 0i, 1 + 0i,$

$$-\frac{1}{2} + i \frac{\sqrt{3}}{2} \text{ and } -\frac{1}{2} - i \frac{\sqrt{3}}{2}.$$

Properties of Conjugate of Complex Numbers

1. $\overline{(z)} = z$, where \bar{z} is the conjugate of complex number z and $\bar{\bar{z}}$ is the conjugate of complex number \bar{z} .
2. $z + \bar{z} = 2 \operatorname{Re}(z)$
3. $z - \bar{z} = 2i \operatorname{Im}(z)$
4. $z = \bar{z} \Leftrightarrow z$ is purely real.
5. $z + \bar{z} = 0 \Leftrightarrow z$ is purely imaginary.
6. $z\bar{z} = (\operatorname{Re}(z))^2 + (\operatorname{Im}(z))^2$
7. $\overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2$
8. $\overline{z_1 - z_2} = \bar{z}_1 - \bar{z}_2$
9. $\overline{z_1 \cdot z_2} = \bar{z}_1 \cdot \bar{z}_2$
10. $\left(\frac{z_1}{z_2}\right) = \frac{\bar{z}_1}{\bar{z}_2}$, provided $z_2, \bar{z}_2 \neq 0$

EXAMPLE |8| If $z_1 = 3 + 2i$ and $z_2 = 2 - i$, then verify that

$$(i) \overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2 \quad (ii) \overline{z_1 z_2} = \bar{z}_1 \bar{z}_2$$

Sol. Given that, $z_1 = 3 + 2i$ and $z_2 = 2 - i$

$$(i) \text{ Now, } \overline{z_1 + z_2} = \overline{(3+2i)+(2-i)} = 5+i$$

$$\Rightarrow \overline{z_1 + z_2} = 5+i = 5-i \quad \dots(i)$$

$$\text{Now, consider } \overline{z_1 + z_2} = \overline{(3+2i)+(2-i)} = 3-2i+2+i = 5-i \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\overline{z_1 + z_2} = \bar{z}_1 + \bar{z}_2$$

$$(ii) \text{ Now, } \overline{z_1 z_2} = \overline{(3+2i)(2-i)} = 6-3i+4i-2i^2$$

$$= 6+i-2(-1) = 8+i \quad [\because i^2 = -1]$$

$$\Rightarrow \overline{z_1 z_2} = \overline{8+i} = 8-i \quad \dots(i)$$

$$\text{Now, consider } \overline{z_1 z_2} = \overline{(3-2i)(2+i)} = 6+3i-4i-2i^2$$

$$= 6-i-2(-1) = 8-i \quad [\because i^2 = -1] \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\overline{z_1 z_2} = \bar{z}_1 \bar{z}_2$$

EXAMPLE |9| If $z_1 = 3 + 5i$ and $z_2 = 2 - 3i$, then verify

that $\overline{\left(\frac{z_1}{z_2}\right)} = \frac{\bar{z}_1}{\bar{z}_2}$

Sol. Given, $z_1 = 3 + 5i$ and $z_2 = 2 - 3i$

$$\text{Now, } \frac{z_1}{z_2} = \frac{3+5i}{2-3i} = \frac{3+5i}{2-3i} \times \frac{2+3i}{2+3i}$$

[by rationalising the denominator]

$$= \frac{6+9i+10i+15i^2}{4-9i^2} = \frac{6+19i-15}{4+9} \quad [\because i^2 = -1]$$

$$= \frac{-9+19i}{13} = \frac{-9}{13} + \frac{19}{13}i \quad \dots(i)$$

$$\therefore \text{LHS} = \overline{\left(\frac{z_1}{z_2}\right)} = \overline{\left(\frac{-9}{13} + \frac{19}{13}i\right)} = \frac{-9}{13} - \frac{19}{13}i$$

$$\text{Now, consider RHS} = \frac{\bar{z}_1}{\bar{z}_2} = \frac{\overline{3+5i}}{\overline{2-3i}} = \frac{3-5i}{2+3i}$$

$$= \frac{3-5i}{2+3i} \times \frac{2-3i}{2-3i}$$

[by rationalising the denominator]

$$= \frac{6-9i-10i+15i^2}{4-9i^2} = \frac{6-19i-15}{4+9} \quad [\because i^2 = -1]$$

$$= \frac{-9-19i}{13} = \frac{-9}{13} - \frac{19}{13}i \quad \dots(ii)$$

From Eqs. (i) and (ii), we get

$$\overline{\left(\frac{z_1}{z_2}\right)} = \frac{\bar{z}_1}{\bar{z}_2}$$

EXAMPLE |10| If $x + iy = \frac{(a^2 + 1)^2}{2a - i}$, what is the value of $x^2 + y^2$?

Sol. We have, $x + iy = \frac{(a^2 + 1)^2}{2a - i}$... (i)

$$\therefore \overline{x + iy} = \overline{\left\{ \frac{(a^2 + 1)^2}{2a - i} \right\}}$$

$$\Rightarrow x - iy = \frac{(a^2 + 1)^2}{2a - i} \quad \left[\because \overline{\left(\frac{z_1}{z_2} \right)} = \frac{\bar{z}_1}{\bar{z}_2} \right]$$

$$\Rightarrow x - iy = \frac{(a^2 + 1)^2}{2a + i} \quad \dots \text{(ii)}$$

On multiplying Eqs. (i) and (ii), we get

$$(x + iy)(x - iy) = \frac{(a^2 + 1)^2(a^2 + 1)^2}{(2a - i)(2a + i)}$$

$$\Rightarrow x^2 - (iy)^2 = \frac{(a^2 + 1)^4}{(2a)^2 - i^2}$$

$$[\because (z_1 + z_2)(z_1 - z_2) = z_1^2 - z_2^2]$$

$$\Rightarrow x^2 - i^2y^2 = \frac{(a^2 + 1)^4}{4a^2 + 1} \quad [\because i^2 = -1]$$

$$\therefore x^2 + y^2 = \frac{(a^2 + 1)^4}{4a^2 + 1}$$

EXAMPLE |11| If $x + iy = \sqrt{\frac{1+i}{1-i}}$, then prove that $x^2 + y^2 = 1$

Sol. We have, $x + iy = \sqrt{\frac{1+i}{1-i}} \Rightarrow x + iy = \sqrt{\frac{1+i}{1-i} \times \frac{1+i}{1+i}}$

[by rationalising the denominator]

$$\Rightarrow x + iy = \sqrt{\frac{(1+i)^2}{1 - i^2}} \quad [\because (z_1 - z_2)(z_1 + z_2) = z_1^2 - z_2^2]$$

$$\Rightarrow x + iy = \frac{1+i}{\sqrt{1+1}} = \frac{1+i}{\sqrt{2}} \quad [\because i^2 = -1]$$

$$= \frac{1}{\sqrt{2}} + \frac{i}{\sqrt{2}} \quad \dots \text{(i)}$$

Now, taking conjugate on both sides, we get

$$\overline{x + iy} = \left(\frac{1}{\sqrt{2}} - \frac{i}{\sqrt{2}} \right) \Rightarrow x - iy = \frac{1}{\sqrt{2}} - \frac{i}{\sqrt{2}} \quad \dots \text{(ii)}$$

On multiplying Eqs. (i) and (ii), we get

$$(x + iy)(x - iy) = \left(\frac{1}{\sqrt{2}} + \frac{i}{\sqrt{2}} \right) \left(\frac{1}{\sqrt{2}} - \frac{i}{\sqrt{2}} \right)$$

$$\Rightarrow x^2 - (iy)^2 = \left(\frac{1}{\sqrt{2}} \right)^2 - \left(\frac{i}{\sqrt{2}} \right)^2$$

$$[\because (z_1 + z_2)(z_1 - z_2) = z_1^2 - z_2^2]$$

$$\Rightarrow x^2 - i^2y^2 = \frac{1}{2} - \frac{i^2}{2} \Rightarrow x^2 + y^2 = \frac{1}{2} + \frac{1}{2} = 1 \quad [\because i^2 = -1]$$

Hence proved.

MODULUS (ABSOLUTE VALUE) OF COMPLEX NUMBERS

The modulus (or absolute value) of a complex number, $z = a + ib$ is defined as the non-negative real number $\sqrt{a^2 + b^2}$. It is denoted by $|z|$. i.e. $|z| = \sqrt{a^2 + b^2}$

e.g. If $z = 2 + 3i$, then $|z| = \sqrt{2^2 + 3^2} = \sqrt{4 + 9} = \sqrt{13}$
and if $z = 1 - i$, then $|z| = \sqrt{(1)^2 + (-1)^2} = \sqrt{1+1} = \sqrt{2}$.

Knowledge Plus

- (i) Multiplicative inverse of z is $\frac{\bar{z}}{|z|^2}$. It is also called reciprocal of z .
- (ii) $z\bar{z} = |z|^2$

EXAMPLE |12| Find the modulus of the complex number $4 + 3i^7$.

 Write the complex number in the form $z = a + ib$, then modulus of z is $|z| = \sqrt{a^2 + b^2}$.

Sol. We have, $4 + 3i^7 = 4 + 3(i^4)(i^2)i$

$$= 4 + 3(1)(-1)i \quad [\because i^4 = 1, i^2 = -1]$$

$$= 4 - 3i$$

$$\therefore \text{Modulus} = |4 + 3i^7| = |4 - 3i|$$

$$= \sqrt{4^2 + (-3)^2} = \sqrt{16 + 9} = \sqrt{25} = 5$$

EXAMPLE |13| Find the modulus of the complex

number $\frac{\sqrt{3} - i\sqrt{2}}{2\sqrt{3} - i\sqrt{2}}$.

 Convert the complex number in the standard form and then find its modulus.

Sol. Let $z = \frac{\sqrt{3} - i\sqrt{2}}{2\sqrt{3} - i\sqrt{2}} = \frac{\sqrt{3} - i\sqrt{2}}{2\sqrt{3} - i\sqrt{2}} \times \frac{2\sqrt{3} + i\sqrt{2}}{2\sqrt{3} + i\sqrt{2}}$

[by rationalising the denominator]

$$= \frac{6 + i\sqrt{6} - 2\sqrt{6}i - 2i^2}{(2\sqrt{3})^2 - (\sqrt{2}i)^2} \quad [\because (z_1 - z_2)(z_1 + z_2) = z_1^2 - z_2^2]$$

$$= \frac{6 - \sqrt{6}i + 2}{12 + 2} \quad [\because i^2 = -1]$$

$$= \frac{8 - \sqrt{6}i}{14} = \frac{8}{14} - \frac{\sqrt{6}}{14}i \Rightarrow z = \frac{4}{7} - \frac{\sqrt{6}}{14}i$$

Now, modulus of z , $|z| = \sqrt{\left(\frac{4}{7}\right)^2 + \left(-\frac{\sqrt{6}}{14}\right)^2}$

$$= \sqrt{\frac{16}{49} + \frac{6}{196}} = \sqrt{\frac{64+6}{196}} = \sqrt{\frac{70}{196}} = \sqrt{\frac{5}{14}}$$

EXAMPLE |14| If $|z| = 1$, then find the value of $\frac{1+z}{1+\bar{z}}$.

 Use the result $z\bar{z} = |z|^2$, then find its value.

Sol. Given, $|z| = 1 \Rightarrow |z|^2 = 1$

$$\Rightarrow z\bar{z} = 1 \quad [\because |z|^2 = z\bar{z}]$$

$$\text{Now, } \frac{1+z}{1+\bar{z}} = \frac{z\bar{z} + z}{1+\bar{z}} = \frac{z(\bar{z} + 1)}{(\bar{z} + 1)} = z \quad [\because 1 = z\bar{z}]$$

EXAMPLE |15| Find the conjugate and modulus of the complex number $(1-i)^{-2} + (1+i)^{-2}$.

Sol. Let $z = (1-i)^{-2} + (1+i)^{-2}$

$$\begin{aligned} &= \frac{1}{(1-i)^2} + \frac{1}{(1+i)^2} = \frac{(1+i)^2 + (1-i)^2}{(1-i)^2(1+i)^2} \\ &= \frac{1+i^2 + 2i + 1 + i^2 - 2i}{(1-i^2)^2} = \frac{1-1+1-1}{(1+1)^2} = \frac{0}{4} \end{aligned}$$

$$[\because i^2 = -1]$$

$$= 0 = 0 + 0i$$

$$\therefore \bar{z} = \overline{0+0i} = 0 \text{ and } |z| = \sqrt{0+0} = 0$$

EXAMPLE |16| Find the conjugate and modulus of the complex number $\frac{3+2i}{2-5i} + \frac{3-2i}{2+5i}$.

Sol. Let $z = \frac{3+2i}{2-5i} + \frac{3-2i}{2+5i}$

$$\begin{aligned} &= \frac{(3+2i)(2+5i) + (3-2i)(2-5i)}{(2-5i)(2+5i)} \\ &= \frac{6+15i+4i+10i^2 + 6-15i-4i+10i^2}{(2)^2-(5i)^2} \\ &= \frac{6+20i^2+6}{4-25i^2} = \frac{12-20}{4+25} = \frac{-8}{29} + 0i \quad [\because i^2 = -1] \end{aligned}$$

$$\text{Now, } \bar{z} = -\frac{8}{29} - 0i = \frac{-8}{29}$$

$$\text{and } |z| = \sqrt{\left(\frac{-8}{29}\right)^2 + 0^2} = \sqrt{\frac{64}{841}} = \frac{8}{29}$$

EXAMPLE |17| If $|z| = 1$, then prove that $\frac{z-1}{z+1}; (z \neq 1)$

is a purely imaginary number. What will you conclude, if $z = 1$?

Sol. Let $z = a+ib$, such that $|z| = \sqrt{a^2+b^2} = 1$

$$\Rightarrow a^2 + b^2 = 1$$

$$\text{Now, consider } \left(\frac{z-1}{z+1}\right) = \left(\frac{a+ib-1}{a+ib+1}\right)$$

$$= \frac{(a-1+ib)}{(a+1+ib)} \times \frac{(a+1-ib)}{(a+1-ib)}$$

[by rationalising the denominator]

$$= \frac{[(a-1)+ib][(a+1)-ib]}{(a+1)^2 - (ib)^2} \quad [\because (z_1+z_2)(z_1-z_2) = z_1^2 - z_2^2]$$

$$= \frac{a^2 - 1 - iab + ib + iab + ib - i^2b^2}{(a+1)^2 - i^2b^2}$$

$$= \frac{(a^2 + b^2 - 1) + 2bi}{(a+1)^2 + b^2} \quad [\because i^2 = -1]$$

$$= \frac{(1-1) + 2bi}{a^2 + 1 + 2a + b^2}$$

$$= \frac{0 + 2bi}{a^2 + 1 + 2a + b^2} \quad [\because a^2 + b^2 = 1]$$

$$= 0 + \frac{bi}{1+a}$$

Clearly, real part of $\left(\frac{z-1}{z+1}\right)$ is zero and imaginary part

of $\left(\frac{z-1}{z+1}\right)$ is $\frac{b}{1+a}$.

$\therefore \left(\frac{z-1}{z+1}\right) = \frac{ib}{1+a}$ is purely imaginary.

Again, when $z = 1$, then

$$\left(\frac{z-1}{z+1}\right) = \frac{1-1}{1+1} = 0, \text{ which is purely real.}$$

EXAMPLE |18| Find the complex number satisfying the equation $z + \sqrt{2}|z+1| + i = 0$. [NCERT Exemplar]

Sol. We have, $z + \sqrt{2}|z+1| + i = 0$

Let $z = x+iy$.

$$\text{Then, } (x+iy) + \sqrt{2}|(x+iy+1)| + i = 0$$

$$\Rightarrow x + i(y+1) + \sqrt{2}|(x+1)+iy| = 0$$

$$\Rightarrow x + i(y+1) + \sqrt{2}\sqrt{(x+1)^2+y^2} = 0$$

$$[\text{if } z = a+ib, \text{ then } |z| = \sqrt{a^2+b^2}]$$

$$\Rightarrow x + \sqrt{2}\sqrt{x^2+1+2x+y^2} + i(y+1) = 0 + 0i$$

On equating real and imaginary part, we get

$$x + \sqrt{2}\sqrt{x^2+1+2x+y^2} = 0 \quad \dots(i)$$

$$\text{and } y+1 = 0 \quad \dots(ii)$$

From Eq. (ii), we get

$$y = -1$$

Now, on substituting $y = -1$ in Eq. (i), we get

$$x + \sqrt{2}\sqrt{x^2+1+2x+1} = 0$$

$$\Rightarrow x = -\sqrt{2}\sqrt{x^2+2x+2}$$

On squaring both sides, we get

$$\begin{aligned}x^2 &= 2(x^2 + 2x + 2) \\ \Rightarrow x^2 &= 2x^2 + 4x + 4 \Rightarrow x^2 + 4x + 4 = 0 \\ \Rightarrow (x+2)^2 &= 0 \Rightarrow x+2=0 \Rightarrow x=-2 \\ \text{Hence, } z &= x+iy = -2-i\end{aligned}$$

Properties of Modulus of Complex Numbers

1. $|z| = |\bar{z}|$
2. $|z| = 0 \Leftrightarrow z = 0$ i.e. $\operatorname{Re}(z) = \operatorname{Im}(z) = 0$
3. $-|z| \leq \operatorname{Re}(z) \leq |z|$
4. $-|z| \leq \operatorname{Im}(z) \leq |z|$
5. $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 + 2\operatorname{Re}(z_1\bar{z}_2)$
6. $|z_1 - z_2|^2 = |z_1|^2 + |z_2|^2 - 2\operatorname{Re}(z_1\bar{z}_2)$
7. $|z_1 + z_2|^2 + |z_1 - z_2|^2 = 2(|z_1|^2 + |z_2|^2)$
8. $|z_1 z_2| = |z_1||z_2|$

In general, if z_1, z_2, \dots, z_n are any complex numbers, then

$$|z_1 z_2 \dots z_n| = |z_1||z_2| \dots |z_n| \quad \dots(\text{i})$$

So, if $z_1 = z_2 = \dots = z_n$, then from Eq. (i), we have $|z_1^n| = |z_1|^n$. Thus, we have $|z^n| = |z|^n$.

$$9. \frac{|z_1|}{|z_2|} = \left| \frac{z_1}{z_2} \right|, \text{ provided } z_2 \neq 0$$

$$10. |z_1 + z_2| \leq |z_1| + |z_2|$$

$$11. |z_1 - z_2| \geq |z_1| - |z_2|$$

Note Property 10 and 11 are called triangle inequality.

Knowledge Plus

In the set of complex number, $z_1 > z_2$ or $z_1 < z_2$ are meaningless but $|z_1| > |z_2|$ or $|z_1| < |z_2|$ are meaningful because $|z_1|$ and $|z_2|$ are real numbers.

EXAMPLE |19| If $z_1 = 3 + 2i$ and $z_2 = 1 - 3i$, then find the modulus of z_1 and z_2 .

Also, verify that $|z_1 z_2| = |z_1||z_2|$.

Sol. Given, $z_1 = 3 + 2i$ and $z_2 = 1 - 3i$

$$\text{Clearly, } |z_1| = \sqrt{(3)^2 + (2)^2} = \sqrt{9+4} = \sqrt{13}$$

$$\text{and } |z_2| = \sqrt{1^2 + (-3)^2} = \sqrt{1+9} = \sqrt{10}$$

$$\therefore |z_1||z_2| = \sqrt{13}\sqrt{10} = \sqrt{130} \quad \dots(\text{i})$$

$$\begin{aligned}\text{Now, consider } z_1 z_2 &= (3+2i)(1-3i) = 3-9i+2i-6i^2 \\ &= 3-7i+6 = 9-7i \quad [\because i^2 = -1]\end{aligned}$$

$$\begin{aligned}\therefore |z_1 z_2| &= \sqrt{9^2 + (-7)^2} \\ &= \sqrt{81+49} = \sqrt{130} \quad \dots(\text{ii})\end{aligned}$$

From Eqs. (i) and (ii), we get $|z_1 z_2| = |z_1||z_2|$

EXAMPLE |20| If $z_1 = 3 + 2i$ and $z_2 = 2 - 4i$, then verify that $|z_1 + z_2|^2 + |z_1 - z_2|^2 = 2(|z_1|^2 + |z_2|^2)$.

Sol. We have, $z_1 = 3 + 2i$ and $z_2 = 2 - 4i$

$$\text{Now, LHS} = |z_1 + z_2|^2 + |z_1 - z_2|^2$$

On substituting the values of z_1 and z_2 , we get

$$\begin{aligned}\text{LHS} &= |3+2i+2-4i|^2 + |3+2i-2+4i|^2 \\ &= |5-2i|^2 + |1+6i|^2 = (5^2 + (-2)^2 + (1)^2 + (6)^2) \\ &\quad [\text{if } z = a+ib, \text{ then } |z|^2 = a^2 + b^2] \\ &= 25 + 4 + 1 + 36\end{aligned}$$

$$\therefore \text{LHS} = 66 \quad \dots(\text{i})$$

$$\text{and RHS} = 2(|z_1|^2 + |z_2|^2) = 2(|3+2i|^2 + |2-4i|^2)$$

$$= 2[(3^2 + (2)^2 + (2)^2 + (-4)^2)]$$

$$= 2(9+4+4+16) = 2 \times 33$$

$$\therefore \text{RHS} = 66 \quad \dots(\text{ii})$$

From Eq. (i) and (ii), we get

$$\text{LHS} = \text{RHS}$$

Hence proved.

EXAMPLE |21| If $z_1 = 3 + i$ and $z_2 = 1 + 4i$, then verify that $|z_1 + z_2| < |z_1| + |z_2|$.

Sol. We have, $z_1 = 3 + i$ and $z_2 = 1 + 4i$

$$\therefore |z_1| = \sqrt{3^2 + 1^2} = \sqrt{9+1} = \sqrt{10}$$

$$\text{and } |z_2| = \sqrt{1^2 + 4^2} = \sqrt{1+16} = \sqrt{17}$$

$$\therefore |z_1| + |z_2| = \sqrt{10} + \sqrt{17}$$

$$= 3.16 + 4.12 = 7.28 \quad \dots(\text{i})$$

$$\text{Now, } z_1 + z_2 = 3+i+1+4i = 4+5i$$

$$\therefore |z_1 + z_2| = \sqrt{4^2 + 5^2} = \sqrt{16+25} = \sqrt{41} = 6.40 \quad \dots(\text{ii})$$

From Eqs. (i) and (ii), we get $|z_1 + z_2| < |z_1| + |z_2|$

EXAMPLE |22| If $z_1 = 2 - i$ and $z_2 = 1 + i$, then

$$\text{find } \left| \frac{z_1 + z_2 + 1}{z_1 - z_2 + 1} \right|$$

[NCERT]

Sol. We have,

$$z_1 = 2 - i \text{ and } z_2 = 1 + i$$

$$\therefore \left| \frac{z_1 + z_2 + 1}{z_1 - z_2 + 1} \right| = \left| \frac{2-i+1+i+1}{2-i-1-i+1} \right|$$

$$= \left| \frac{4}{2-2i} \right| = \left| \frac{2}{1-i} \right| = \frac{2}{|1-i|} \quad \left[\because \left| \frac{z_1}{z_2} \right| = \frac{|z_1|}{|z_2|} \right]$$

$$= \frac{2}{\sqrt{(1)^2 + (-1)^2}} = \frac{2}{\sqrt{1+1}} = \frac{2}{\sqrt{2}} \times \frac{\sqrt{2}}{\sqrt{2}} = \sqrt{2}$$

EXAMPLE | 23| Find $\left|(1+i)\frac{(2+i)}{(3+i)}\right|$. [NCERT Exemplar]

$$\begin{aligned} \text{Sol. Let } z &= \frac{(1+i)(2+i)}{(3+i)} = \frac{2+i+2i+i^2}{3+i} = \frac{2+3i-1}{3+i} \\ &\Rightarrow z = \frac{1+3i}{3+i} \quad [\because i^2 = -1] \\ \text{Now, } |z| &= \left| \frac{1+3i}{3+i} \right| = \frac{|1+3i|}{|3+i|} \quad \left[\because \left| \frac{z_1}{z_2} \right| = \frac{|z_1|}{|z_2|} \right] \\ &= \frac{\sqrt{1^2 + 3^2}}{\sqrt{3^2 + 1^2}} = 1 \\ \text{Hence, } \left| \frac{(1+i)(2+i)}{(3+i)} \right| &= 1 \end{aligned}$$

EXAMPLE | 24| If z_1, z_2 are complex numbers such that

$\frac{4z_1}{5z_2}$ is purely imaginary number, then find $\left| \frac{z_1 - z_2}{z_1 + z_2} \right|$.

Sol. Since, $\frac{4z_1}{5z_2}$ is purely imaginary number.

$$\therefore \frac{4z_1}{5z_2} = \lambda i \text{ for some } \lambda \in R \Rightarrow \frac{z_1}{z_2} = \frac{5\lambda}{4} i \quad \dots(i)$$

Now, consider $\left| \frac{z_1 - z_2}{z_1 + z_2} \right| = \left| \frac{\frac{z_1}{z_2} - 1}{\frac{z_1}{z_2} + 1} \right|$

[dividing numerator and denominator by z_2]

$$\begin{aligned} &= \left| \frac{\frac{5\lambda i - 1}{4}}{\frac{5\lambda i + 1}{4}} \right| = \left| \frac{5\lambda i - 1}{5\lambda i + 1} \right| \quad [\text{using Eq. (i)}] \\ &= \frac{|5\lambda i - 1|}{|5\lambda i + 1|} = \frac{|-4 + 5\lambda i|}{|4 + 5\lambda i|} = \frac{\sqrt{(-4)^2 + (5\lambda)^2}}{\sqrt{(-4)^2 + (5\lambda)^2}} = 1 \end{aligned}$$

$$\text{Hence, } \left| \frac{z_1 - z_2}{z_1 + z_2} \right| = 1$$

EXAMPLE | 25| If $(2+i)(2+2i)(2+3i) \dots (2+ni) = x+iy$, then prove that $5 \cdot 8 \cdot 13 \dots (4+n^2) = x^2 + y^2$.

[NCERT Exemplar]

Sol. We have, $(2+i)(2+2i)(2+3i) \dots (2+ni) = x+iy$

On taking modulus both sides, we get

$$\begin{aligned} &|(2+i)(2+2i)(2+3i) \dots (2+ni)| = |x+iy| \\ &\Rightarrow |2+i||2+2i| \dots |2+ni| = |x+iy| \\ &\quad [\because |z_1 z_2 \dots z_n| = |z_1||z_2| \dots |z_n|] \\ &\Rightarrow (\sqrt{4+1})(\sqrt{4+4}) \dots (\sqrt{4+n^2}) = \sqrt{x^2 + y^2} \end{aligned}$$

On squaring both sides, we get

$$5 \cdot 8 \dots (4+n^2) = x^2 + y^2 \quad \text{Hence proved.}$$

ARGAND PLANE

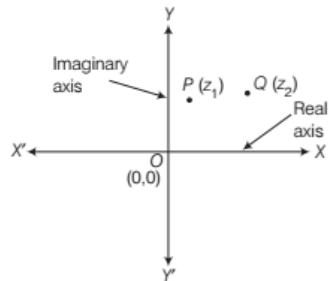

A complex number $z = a+ib$ can be represented by a unique point $P(a, b)$ in the cartesian plane referred to a pair of rectangular axes. A purely real number a , i.e. $(a+0i)$ is represented by the point $(a, 0)$ on X -axis. Therefore, X -axis is called **real axis**.

A purely imaginary number ib i.e. $(0+bi)$ is represented by the point $(0, b)$ on Y -axis. Therefore, Y -axis is called **imaginary axis**. The intersection (common) of two axes is called zero complex number i.e. $z = 0+0i$.

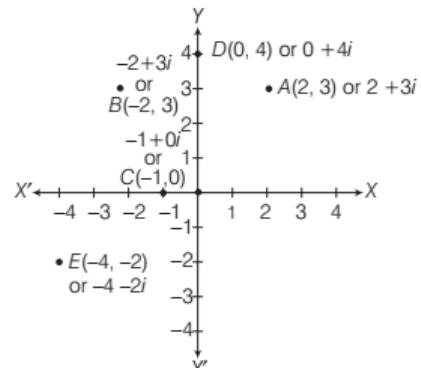

Similarly, the representation of complex numbers as points in the plane is known as **Argand diagram**. The plane representing complex numbers as points, is called **Complex plane or Argand plane or Gaussian plane**.

If two complex numbers z_1 and z_2 are represented by the points P and Q in the complex plane, then

$$|z_1 - z_2| = PQ = \text{Distance between } P \text{ and } Q$$

e.g. The complex numbers such as $2+3i$, $-2+3i$, $-1+0i$, $0+4i$ and $-4-2i$ which correspond to the ordered pairs $(2, 3)$, $(-2, 3)$, $(-1, 0)$, $(0, 4)$ and $(-4, -2)$ respectively, can be represented geometrically by the points A, B, C, D and E respectively, in the cartesian plane, as shown in the figure.

EXAMPLE | 26| If $z_1 = \sqrt{3} + i\sqrt{3}$ and $z_2 = \sqrt{3} + i$, then find the quadrant in which $\left(\frac{z_1}{z_2} \right)$ lies. [NCERT Exemplar]

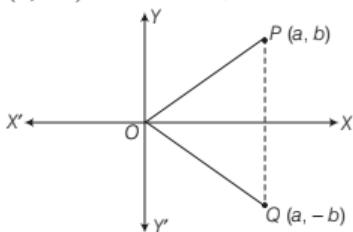

Sol. We have, $z_1 = \sqrt{3} + i\sqrt{3}$ and $z_2 = \sqrt{3} + i$.

$$\begin{aligned}\therefore \frac{z_1}{z_2} &= \frac{\sqrt{3}(1+i)}{\sqrt{3}+i} = \frac{\sqrt{3}(1+i)}{(\sqrt{3}+i)} \times \frac{\sqrt{3}-i}{\sqrt{3}-i} \\ &\quad [\text{by rationalising the denominator}] \\ &= \frac{\sqrt{3}(1+i)(\sqrt{3}-i)}{(\sqrt{3})^2 - (i)^2} \\ &\quad [:\cdot(z_1+z_2)(z_1-z_2) = z_1^2 - z_2^2] \\ &= \frac{\sqrt{3}(\sqrt{3}-i+i\sqrt{3}-i^2)}{3-i^2} \\ &= \frac{\sqrt{3}(\sqrt{3}+i(\sqrt{3}-1)+1)}{3+1} \quad [:\cdot i^2 = -1] \\ &= \frac{\sqrt{3}}{4}((\sqrt{3}+1)+i(\sqrt{3}-1)) \\ &= \frac{\sqrt{3}(\sqrt{3}+1)}{4} + \frac{i\sqrt{3}(\sqrt{3}-1)}{4}\end{aligned}$$

which is represented by a point in first quadrant.

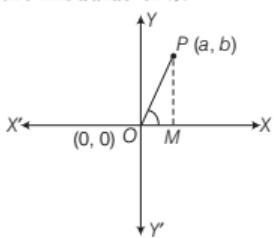

Representation of Conjugate of z on Argand Plane

Geometrically, the mirror image of the complex number $z = a + ib$ (represented by the ordered pair (a, b)) about the X -axis is called **conjugate of z** which is represented by the ordered pair $(a, -b)$. If $z = a + ib$, then $\bar{z} = a - ib$.

Representation of Modulus of z on Argand Plane

Geometrically, the distance of the complex number $z = a + ib$ [represented by the ordered pair (a, b)] from origin, is called the modulus of z .

$$\begin{aligned}\therefore OP &= \sqrt{(a-0)^2 + (b-0)^2} \\ &= \sqrt{a^2 + b^2} = \sqrt{\{\operatorname{Re}(z)\}^2 + \{\operatorname{Im}(z)\}^2} = |a+ib|\end{aligned}$$

TOPIC PRACTICE 3

OBJECTIVE TYPE QUESTIONS

1. The conjugate of a complex number $z = a + ib$, is

- (a) $\bar{z} = a + ib$
- (b) $\bar{z} = a - ib$
- (c) $\bar{z} = ia + b$
- (d) $\bar{z} = ia - b$

2. Which of the following are correct?

I. $|3+i| = \sqrt{10}$; $|2-5i| = \sqrt{29}$

II. $\overline{(3+i)} = 3-i$; $\overline{(2-5i)} = 2+5i$ and

$\overline{(-3i-5)} = 3i-5$

III. $z^{-1} = \frac{\bar{z}}{|z|^2}$ or $z\bar{z} = |z|^2$, $z \neq 0$

- (a) I and III are correct
- (b) I and II are correct
- (c) All are correct
- (d) None of these

3. If $|1-i|^n = 2^n$, then n is equal to

- (a) 1
- (b) 0
- (c) -1
- (d) None of these

4. The value of $(z+3)(\bar{z}+3)$ is equivalent to

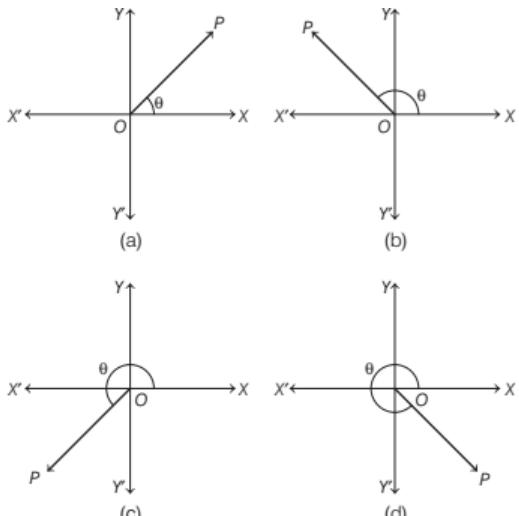

- (a) $|z+3|^2$
- (b) $|z-3|$
- (c) $z^2 + 3$
- (d) None of these

5. If $a+ib = c+id$, then

- (a) $a^2 + c^2 = 0$
- (b) $b^2 + c^2 = 0$
- (c) $b^2 + d^2 = 0$
- (d) $a^2 + b^2 = c^2 + d^2$

6. The geometrical representation of complex

number $z = \frac{-16}{1+i\sqrt{3}}$, is

VERY SHORT Type Questions

- 7 Find the conjugate of the complex numbers.
(i) $-i\sqrt{5}$ (ii) $\sqrt{3}$
- 8 Find the complex conjugates of
(i) $2+i5$ (ii) $-6-i7$ (iii) $\sqrt{3}$
- 9 Find the multiplicative inverse of the complex number $\sqrt{5}+3i$. [NCERT]
- 10 If $(1+i)z = (1-i)\bar{z}$, then show that $z = -i\bar{z}$.
[NCERT Exemplar]
- 11 Find the modulus of the conjugate of the complex number $-3i$.
- 12 Find the number of non-zero integral solutions of the equation $|1-i|^x = 2^x$.

SHORT ANSWER Type Questions

- 13 If $z_1 = \sqrt{2}-3i$ and $z_2 = 5-i\sqrt{2}$, then find the quadrant in which $\frac{z_1}{z_2}$ lies.
- 14 Find the conjugate of the complex number $\frac{1-i}{1+i}$.
[NCERT Exemplar]
- 15 Find the conjugate of $(6+5i)^2$.
- 16 Find the real numbers x and y , if $(x-iy)(3+5i)$ is the conjugate of $(-1-3i)$.
- 17 Find the conjugate and modulus of the complex number $(3-2i)(3+2i)(1+i)$.
- 18 If $z = 12+5i$, then verify that
(i) $(\bar{z}) = z$ (ii) $z + \bar{z} = 2\operatorname{Re}(z)$
- 19 Find the modulus of the complex number $4+3i^7$.
- 20 Find the conjugate and modulus of the complex number $\frac{2+3i}{3+2i}$.
- 21 If $(a+ib)(c+id)(e+if)(g+ih) = A+iB$, then show that
$$(a^2+b^2)(c^2+d^2)(e^2+f^2)(g^2+h^2) = A^2+B^2.$$

[NCERT]

LONG ANSWER Type I Questions

- 22 Find the conjugate of
$$\frac{(3-2i)(2+3i)}{(1+2i)(2-i)}.$$
 [NCERT]
- 23 Find real values of x and y for which the complex numbers $-3+ix^2y$ and x^2+y+4i are conjugate of each other.
- 24 Find all non-zero complex numbers z satisfying $\bar{z} = iz^2$.
- 25 If $x+iy = \frac{a+ib}{a-ib}$, prove that $x^2 + y^2 = 1$.
[NCERT]
- 26 If $a+ib = \frac{(x^2+1)}{2x^2+1}$, prove that
$$a^2 + b^2 = \frac{(x^2+1)^2}{(2x^2+1)^2}.$$
 [NCERT]
- 27 Find the modulus of $\frac{1+i}{1-i} - \frac{1-i}{1+i}$.
- 28 If $z = 12-5i$, then verify that
(i) $-|z| \leq \operatorname{Re}(z) \leq |z|$
(ii) $-|z| \leq \operatorname{Im}(z) \leq |z|$
- 29 If $z_1 = 3+i$ and $z_2 = 1+4i$, then verify that $|z_1 - z_2| \geq |z_2| - |z_1|$.
- 30 If $f(z) = \frac{7-z}{1-z^2}$, where $z = 1+2i$, then find $|f(z)|$.
[NCERT Exemplar]
- 31 If $\frac{z-1}{z+1}$ is a purely imaginary number ($z \neq -1$), then find the value of $|z|$.
[NCERT Exemplar]
- 32 If $|z+1| = z+2(1+i)$, then find z .
- 33 If $z = x+iy$, $w = \frac{1-iz}{z-i}$ and $|w|=1$, then show that z is purely real.
- 34 If z is a complex number such that $|z-1| = |z+1|$, then show that $\operatorname{Re}(z) = 0$.

HINTS & ANSWERS

1. (b) By definition, $\bar{z} = a - ib$.

2. (c) I. $|3+i| = \sqrt{3^2+1^2} = \sqrt{10}$, $|2-5i| = \sqrt{2^2+(-5)^2} = \sqrt{29}$

II. $\overline{(3+i)} = 3-i$, $\overline{(2-5i)} = 2+5i$, $\overline{(-3i-5)} = 3i-5$

III. The multiplicative inverse of the non-zero complex number z is given by

$$\begin{aligned} z^{-1} &= \frac{1}{a+ib} = \frac{a}{a^2+b^2} + i \frac{-b}{a^2+b^2} \\ &= \frac{a-ib}{a^2+b^2} = \frac{\bar{z}}{|z|^2} \end{aligned}$$

$$\therefore z^{-1} = \frac{\bar{z}}{|z|^2} \text{ or } z\bar{z} = |z|^2$$

3. (b) We know that, if two complex numbers are equal then their modulus must also be equal.

$$\begin{aligned} |1-i|^n &= 2^n \\ \Rightarrow (\sqrt{2})^n &= 2^n \quad [\because |1-i| = \sqrt{2}] \\ \Rightarrow 2^{n/2} &= 2^n \\ \Rightarrow \frac{n}{2} &= n \\ \Rightarrow n &= 0 \end{aligned}$$

4. (a) Let $z = x + iy$

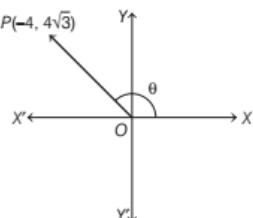

$$\begin{aligned} \text{Then, } (z+3)(\bar{z}+3) &= (x+iy+3)(x+3-iy) \\ &= (x+3)^2 - (iy)^2 = (x+3)^2 + y^2 \\ &= |x+3+iy|^2 = |z+3|^2 \end{aligned}$$

5. (d) If two complex numbers $z_1 = x_1 + iy_1$ and $z_2 = x_2 + iy_2$ are equal, then

$$\begin{aligned} |z_1| &= |z_2| \\ \Rightarrow \sqrt{x_1^2 + y_1^2} &= \sqrt{x_2^2 + y_2^2} \end{aligned}$$

$$\begin{aligned} \text{6. (b) We have, } z &= \frac{-16}{1+i\sqrt{3}} \times \frac{1-i\sqrt{3}}{1-i\sqrt{3}} \\ &= \frac{-16(1-i\sqrt{3})}{1^2 - (i\sqrt{3})^2} \\ &= \frac{-16(1-i\sqrt{3})}{1+3} \\ &= -4+4i\sqrt{3}, \end{aligned}$$

which can be represented geometrically as shown below.

7. (i) $z = 0 - i\sqrt{5} \Rightarrow \bar{z} = 0 + i\sqrt{5}$ **Ans.** $i\sqrt{5}$

(ii) $\sqrt{3}$ **Ans.** $-6+7i$

8. (i) $2+i5 = 2-i5$

Ans. $2-5i$ (ii) $\overline{-6-i7} = -6+i7$

(iii) $\sqrt{3} = \overline{\sqrt{3}+0i} = \sqrt{3}-0i$ **Ans.** $\sqrt{3}$

9. Use formula, multiplication of $z = \frac{\bar{z}}{|z|^2}$ **Ans.** $\frac{\sqrt{5}}{14} - \frac{3}{14}i$

10. We have, $(1+i)z = (1-i)\bar{z}$

$$\Rightarrow \frac{z}{\bar{z}} = \frac{1-i}{1+i} \times \frac{1-i}{1-i} = \frac{1-1-2i}{1+1}$$

11. $z = 3i \Rightarrow \bar{z} = 3i$ **Ans.** 3

12. We have, $(\sqrt{1^2+(-1)^2})^x = 2^x \Rightarrow 2^{x/2} = 2^x \Rightarrow \frac{x}{2} = x$

Ans. $x = 0$

13. Solve as Example 26. **Ans.** IVth quadrant

14. $z = \frac{1-i}{1+i} \times \frac{1-i}{1-i} = \frac{1-1-2i}{1+1} = -i$ **Ans.** i

15. $z = (6+5i)^2 = 36 - 25 + 60i = 11 + 60i$ **Ans.** $11 - 60i$

16. Solve as Example 4. **Ans.** $x = \frac{6}{17}$ and $y = -\frac{7}{17}$

17. Let $z = (3-2i)(3+2i)(1+i)$

$\therefore z = (9+6i-6i-4i^2)(1+i)$

$= (9+4)(1+i) = 13+13i$

Ans. $\bar{z} = 13 - 13i$ and $|z| = 13\sqrt{2}$

18. $z = 4+3i^4i^3 = 4-3i$ **Ans.** 5

20. $z = \frac{2+3i}{3+2i} \times \frac{3-2i}{3-2i} = \frac{12+5i}{13}$

Ans. $\bar{z} = \frac{12}{13} - \frac{5}{13}i$ and $|z| = 1$

21. Solve as Example 25.

22. $z = \frac{12+5i}{4+3i} \times \frac{4-3i}{4-3i} = \frac{63-16i}{16+9}$ **Ans.** $\frac{63}{25} + \frac{16}{25}i$

23. Since, $-3+ix^2y$ and x^2+y+4i are conjugate of each other

$\therefore -3+ix^2y = \overline{x^2+y+4i}$

After this, equate real and imaginary parts, to get the values of x and y .

Ans. $(x=1, y=-4)$

or $(x=-1, y=-4)$

24. Solve as Example 7.

Ans. $0+0i, 0+i, \frac{\sqrt{3}}{2} - \frac{1}{2}i, -\frac{\sqrt{3}}{2} - \frac{1}{2}i$

25. We have, $x + iy = \frac{a + ib}{a - ib}$... (i)

Take modulus both sides of Eq. (i) and then solve it.

26. We have, $a + ib = \frac{x^2 + 1}{2x^2 + 1}$... (i)

Take modulus both sides of Eq. (i) and then solve it.

27. $\frac{(1+i)^2 - (1-i)^2}{1^2 - i^2} = \frac{4i}{2} = 2i$ Ans. 2

28. Hint $|z|=13$

$$\operatorname{Re}(z)=12$$

$$\operatorname{Im}(z)=-5$$

29. $|z_1 - z_2| = |2 - 3i| = \sqrt{4+9} = \sqrt{13}$
 $|z_1| = \sqrt{9+1} = \sqrt{10}$ and $|z_2| = \sqrt{1+16} = \sqrt{17}$

30. $\frac{2-i}{2}$

31. Let $z = x + iy$, then

$$\frac{z-1}{z+1} = \frac{(x^2-1)+y^2+i[y(x+1)-y(x-1)]}{(x^2+1)^2+y^2}$$

$\therefore \frac{z-1}{z+1}$ is purely imaginary.

$$\therefore \operatorname{Re}\left(\frac{z-1}{z+1}\right) = 0, \text{ i.e. } \frac{(x^2-1)+y^2}{(x+1)^2+y^2} = 0$$

$$x^2 - 1 + y^2 = 0 \Rightarrow x^2 + y^2 = 1$$

Ans. $|z|=1$

32. Let $z = x + iy$, then

$$\begin{aligned} |x + iy + 1| &= x + iy + 2(1+i) \\ \Rightarrow \sqrt{(x+1)^2 + y^2} &= x + 2 + i(y+2) \end{aligned}$$

Ans. $z = \frac{1}{2} - 2i$

33. We have,

$$\begin{aligned} |w| &= 1 \\ \Rightarrow \frac{|1 - iz|}{|z - i|} &= 1 \\ \Rightarrow |1 - iz| &= |z - i| \\ \Rightarrow |1 + y - ix| &= |x + i(y - 1)| \\ 34. \text{ Let } z = x + iy, \text{ then } |z - 1| &= |z + 1| \\ \Rightarrow |x + iy - 1| &= |x + iy + 1| \\ \Rightarrow |(x-1) + iy| &= |(x+1) + iy| \\ \Rightarrow \sqrt{(x-1)^2 + y^2} &= \sqrt{(x+1)^2 + y^2} \\ \Rightarrow (x-1)^2 + y^2 &= (x+1)^2 + y^2 \\ \Rightarrow x^2 + 1 - 2x &= x^2 + 1 + 2x \\ \Rightarrow 4x &= 0 \\ \therefore \operatorname{Re}(z) &= 0 \end{aligned}$$

SUMMARY

- A number consisting of real number and imaginary number is called **complex number**, i.e. $z = a + ib$, where a is **real part** $\text{Re}(z)$ and b is **imaginary part** $\text{Im}(z)$.
- A complex number $z = a + ib$ is called purely real, if $b = 0$, i.e. $\text{Im}(z) = 0$ and is called purely imaginary, if $a = 0$, i.e. $\text{Re}(z) = 0$.

- **Integral Powers of i**

$$\begin{array}{lll} \text{(i)} i^{4q} = 1, q \in N & \text{(ii)} i^{4q+1} = i, q \in N & \text{(iii)} i^{4q+2} = -1, q \in N \\ \text{(v)} i^{-p} = \frac{1}{i^p}, p \in N & & \text{(iv)} i^{4q+3} = -i, q \in N \end{array}$$

- Two complex numbers $z_1 = a + ib$ and $z_2 = c + id$ are said to be equal, if $a = c$ and $b = d$.
- **Algebra of Complex Numbers** Let two complex numbers are $z_1 = a_1 + ib_1$ and $z_2 = a_2 + ib_2$, then their

(i) **Addition** (sum) is defined as

$$z = z_1 + z_2 = (a_1 + a_2) + i(b_1 + b_2).$$

(ii) **Subtraction** $z_1 - z_2$ is defined as the addition of z_1 and $(-z_2)$

$$\text{i.e. } z_1 - z_2 = z_1 + (-z_2) = (a_1 - a_2) + i(b_1 - b_2).$$

(iii) **Multiplication** is defined as $z_1 z_2 = (a + ib)(c + id) = (ac - bd) + i(ad + bd)$

(iv) **Division** $\frac{z_1}{z_2}$ is defined as the multiplication of z_1 by the multiplicative inverse of z_2

$$\text{i.e. } \frac{z_1}{z_2} = z_1 \cdot z_2^{-1} = \left(\frac{a_1 a_2 + b_1 b_2}{a_2^2 + b_2^2} \right) + i \left(\frac{a_2 b_1 - a_1 b_2}{a_2^2 + b_2^2} \right)$$

- The conjugate \bar{z} of a complex number z , is the complex number obtained by changing the sign of imaginary part of z .
- The modulus $|z|$ (or absolute value) of a complex number $z = a + ib$ is defined as the non-negative real number.

CHAPTER PRACTICE

OBJECTIVE TYPE QUESTIONS

1. If $x = \sqrt{-16}$, then

(a) $x = 4i$	(b) $x = 4$
(c) $x = -4$	(d) All of these
2. Which of the following is true?

(a) $1 - i < 1 + i$	(b) $2i + 1 > -2i + 1$
(c) $2i > 1$	(d) None of these
3. If $z + 0 = z$, where $z = x + iy$ and $0 = 0 + i0$, then 0 is called

(a) additive identity	(b) additive inverse
(c) closure	(d) None of these
4. If $z_1 = 2 + 3i$ and $z_2 = 3 - 2i$, then $z_1 - z_2$ is equal to

(a) $-1 + 5i$	(b) $5 - i$
(c) $i + 5$	(d) None of these
5. If $z = 5i\left(-\frac{3}{5}i\right)$, then z is equal to

(a) $0 + 3i$	(b) $3 + 0i$	(c) $0 - 3i$	(d) $-3 + 0i$
--------------	--------------	--------------	---------------
6. If $z = i^9 + i^{19}$, then z is equal to

(a) $0 + 0i$	(b) $1 + 0i$	(c) $0 + i$	(d) $1 + 2i$
--------------	--------------	-------------	--------------
7. If $z \neq 0$ is a complex number, then

(a) $\operatorname{Re}(z) = 0 \Rightarrow \operatorname{Im}(z^2) = 0$
(b) $\operatorname{Re}(z^2) = 0 \Rightarrow \operatorname{Im}(z^2) = 0$
(c) $\operatorname{Re}(z) = 0 \Rightarrow \operatorname{Re}(z^2) = 0$
(d) None of the above

VERY SHORT ANSWER Type Questions

8. Find the values of x and y , if $x + 4iy = ix + y + 3$.
 9. Show that $1 + i^{10} + i^{20} + i^{30}$ is a real number.
 10. Find the value of $1 + i^2 + i^4 + i^6 + \dots + i^{20}$.
- [NCERT Exemplar]
11. Find the value of i^{-1097} .
 12. Prove that $\left(\frac{2+3i}{3+4i}\right)\left(\frac{2-3i}{3-4i}\right)$ is purely real.
 13. Express $\left(-2 - \frac{1}{3}i\right)^3$ in the form $a + ib$.

14. Express $\frac{1}{-2 + \sqrt{-3}}$ in the form $a + ib$.

15. Express $\frac{2 - \sqrt{-25}}{1 - \sqrt{-16}}$ in the form $a + ib$.

SHORT ANSWER Type I Questions

16. Express $\frac{1}{1 - \cos \theta + 2i \sin \theta}$ in the form $a + ib$.
17. Find the smallest positive integral value of n for which $\frac{(1+i)^n}{(1-i)^{n-2}}$ is a real number.
18. What is the reciprocal of $3 + \sqrt{7}i$?
19. Find the multiplicative inverse of $1 + i$.
20. Find the quadrant in which conjugate of $\frac{1+2i}{1-i}$ lies.

SHORT ANSWER Type II Questions

21. If $z = 2 - 3i$, show that $z^2 - 4z + 13 = 0$ and hence find the value of $4z^3 - 3z^2 + 169$.
22. If $(1+i)(1+2i)(1+3i)\dots(1+ni) = (x+iy)$, then show that $2 \cdot 5 \cdot 10 \dots (1+n^2) = x^2 + y^2$.
23. If $|z_1| = |z_2| = \dots = |z_n| = 1$, then show that $|z_1 + z_2 + \dots + z_n| = \left| \frac{1}{z_1} + \frac{1}{z_2} + \dots + \frac{1}{z_n} \right|$.

CASE BASED Questions

24. A complex number z is pure real if and only if $\bar{z} = z$ and is pure imaginary if and only if $\bar{z} = -z$. Based on the above information answer the following questions.
 - (i) If $(1+i)z = (1-i)\bar{z}$, then $-i\bar{z}$ is

(a) $-\bar{z}$	(b) z	(c) \bar{z}	(d) z^{-1}
----------------	---------	---------------	--------------
 - (ii) $\overline{z_1 z_2}$ is

(a) $\bar{z}_1 \bar{z}_2$	(b) $\bar{z}_1 + \bar{z}_2$	(c) $\frac{\bar{z}_1}{\bar{z}_2}$	(d) $\frac{1}{\bar{z}_1 \bar{z}_2}$
---------------------------	-----------------------------	-----------------------------------	-------------------------------------

- (iii) If x and y are real numbers and the complex number $\frac{(2+i)x-i}{4+i} + \frac{(1-i)y+2i}{4i}$ is pure real, the relation between x and y is
 (a) $8x - 17y = 16$ (b) $8x + 17y = 16$
 (c) $17x - 8y = 16$ (d) $17x - 8y = -16$
- (iv) If $z = \frac{3+2i \sin \theta}{1-2i \sin \theta} \left(0 < \theta \leq \frac{\pi}{2}\right)$ is pure imaginary, then θ is equal to
 (a) $\frac{\pi}{4}$ (b) $\frac{\pi}{6}$ (c) $\frac{\pi}{3}$ (d) $\frac{\pi}{12}$

(v) If z_1 and z_2 are complex numbers such that

$$\left| \frac{z_1 - z_2}{z_1 + z_2} \right| = 1$$

- (a) $\frac{z_1}{z_2}$ is pure real
 (b) $\frac{z_1}{z_2}$ is pure imaginary
 (c) z_1 is pure real
 (d) z_1 and z_2 are pure imaginary

HINTS & ANSWERS

1. (a) Here, $x = \sqrt{-16}$

$$x = \sqrt{-1 \times 16} \\ = \sqrt{-1} \times \sqrt{4 \times 4} = 4i$$

2. (d) Since, comparison of complex numbers is not valid.

3. (a) For every complex number z , we have a complex number $0+i0$ (denoted by 0) called additive identity or zero complex number such that $z+0=z$.

4. (a) Here, $z_1 = 2+3i$, $z_2 = 3-2i$, then

$$z_1 - z_2 = 2+3i - (3-2i) \\ = 2+3i - 3+2i = -1+5i$$

5. (b) $5i \left(-\frac{3}{5}i\right) = 5 \times -\frac{3}{5}i^2 = -3(-1) = 3 = 3+0i$

6. (a) $i^9 + i^{19} = i^9 (1 + i^{10}) = i^9 [1 + (i^2)^5]$ (taking i^9 common)
 $= i^9 [1 + (-1)^5] = i^9 (1 - 1) = 0 = 0 + 0i$

7. (a) Let $z = x + iy$

If $\operatorname{Re}(z) = 0$, then $z = iy$

$$z^2 = (iy)^2 = -y^2$$

Thus, $z^2 = -y^2$ (which is real)

$$\Rightarrow \operatorname{Im}(z^2) = 0$$

8. $x + 4iy = ix + y + 3 \Rightarrow x = y + 3$ and $4y = x$

Ans. $x = 4$ and $y = 1$

9. $1 + i^{10} + i^{20} + i^{30} = 1 + (i^4)^2 i^2 + (i^4)^5 + (i^4)^7 i^2$
 $= 1 - 1 + 1 - 1 = 0$

10. $1 + i^2 + i^4 + \dots + i^{20} = \frac{1((i^2)^{11} - 1)}{(i^2) - 1} = \frac{1(-1 - 1)}{-1 - 1}$ Ans. 1

11. $i^{-1097} = \frac{1}{i^{4 \times 274+1}} = \frac{1}{i} \times \frac{i}{i}$ Ans. $-i$

12. $\left(\frac{2+3i}{3+4i}\right) \left(\frac{2-3i}{3-4i}\right) = \frac{(2)^2 - (3i)^2}{(3)^2 - (4i)^2}$
 $= \frac{4+9}{9+4} = 1$

$$13. \left(-2 - \frac{1}{3}i\right)^3 = \left[(2)^3 + \left(\frac{1}{3}i\right)^3 + 3 \times 2^2 \times \left(\frac{i}{3}\right) + 3 \times 2 \times \left(\frac{i}{3}\right)^2\right] \\ = \left[8 - \frac{i}{27} + 4i - \frac{2}{3}\right] \quad \text{Ans. } -\frac{22}{3} - \frac{107}{27}i$$

14. $\frac{1}{-2+\sqrt{3}i} \times \frac{-2-\sqrt{3}i}{-2-\sqrt{3}i} = \frac{-2-\sqrt{3}i}{(-2)^2 - (\sqrt{3}i)^2} = \frac{-2-\sqrt{3}i}{4+3}$
 $\text{Ans. } -\frac{2}{7} - \frac{\sqrt{3}}{7}i$

15. $\frac{2-\sqrt{25i}}{1-\sqrt{16i}} = \frac{2-5i}{1-4i} \times \frac{1+4i}{1+4i} = \frac{22+3i}{17} \quad \text{Ans. } \frac{22}{17} + \frac{3}{17}i$

16. $z = \frac{1}{(1-\cos\theta)+2-\sin\theta} \times \frac{(1-\cos\theta)-2i\sin\theta}{(1-\cos\theta)-2i\sin\theta}$
 $= \frac{(1-\cos\theta)-2i\sin\theta}{(1-\cos\theta)^2 + 4\sin^2\theta} = \frac{(1-\cos\theta)-2i\sin\theta}{1+\cos^2\theta-2\cos\theta+4\sin^2\theta}$
 $\text{Ans. } \left(\frac{1-\cos\theta}{2-2\cos\theta+3\sin^2\theta}\right) + i\left(\frac{-2\sin\theta}{2-2\cos\theta+3\sin^2\theta}\right)$

17. $z = \left(\frac{1+i}{1-i}\right)^n \times (1-i)^2 = \left[\left(\frac{(1+i)^2}{1^2-i^2}\right)\right]^n (1^2+i^2-2i)$
 $= \left(\frac{1-1+2i}{2}\right)^n (-2i) = (i)^n (-2i) \quad \text{Ans. 1}$

18. $z = 3 + \sqrt{7}i$
 $\therefore \frac{1}{z} = \frac{1}{3 + \sqrt{7}i} \times \frac{3 - \sqrt{7}i}{3 - \sqrt{7}i} = \frac{3 - \sqrt{7}i}{9 + 7} \quad \text{Ans. } \frac{3}{16} - \frac{\sqrt{7}}{16}i$

19. $z = 1+i$
 $\therefore \text{Multiplicative inverse} = \frac{1}{z} = \frac{1}{1+i} \times \frac{1-i}{1-i} = \frac{1-i}{2}$
 $\text{Ans. } \frac{1}{2} - \frac{i}{2}$

20. $z = \frac{1+2i}{1-i} \times \frac{1+i}{1+i} = \frac{-1+3i}{1+1} = \frac{1}{2}(-1+3i)$
 $\therefore \bar{z} = \frac{1}{2}(-1-3i)$
 $\text{Ans. IIIrd quadrant}$

21. Now, $z^2 = (2-3i)^2 = 4-9-12i = -5-12i$ and $z^3 = (2-3i)^3 = (2)^3 - (3i)^3 - 3(2)^2(3i) + 3(2)(3i)^2 = 8+27i-36i-54 = -46-9i$

Now, $z^2 - 4z + 13 = (-5-12i) - 4(2-3i) + 13 = 0$
and $4z^3 - 3z^2 + 169 = -46-9i - 3(-5-12i) + 169$

Ans. 138 + 27 i

22. $|(1+i)(1+2i)(1+3i)\dots(1+ni)| = |x+iy|$

$$\Rightarrow |1+i||1+2i||1+3i|\dots|1+ni| = |x+iy| \\ \Rightarrow \sqrt{1+1}\sqrt{1+4}\sqrt{1+9}\dots\sqrt{1+n^2} = \sqrt{x^2+y^2} \\ \Rightarrow \sqrt{2}\sqrt{5}\sqrt{10}\dots\sqrt{1+n^2} = \sqrt{x^2+y^2}$$

23. Given, $|z_1| = |z_2| = \dots = |z_n| = 1$

$$\Rightarrow |z_1|^2 = |z_2|^2 = \dots = |z_n|^2 = 1$$

$$\therefore z_1\bar{z}_1 = z_2\bar{z}_2 = \dots = z_n\bar{z}_n = 1$$

$$\therefore z_1 = \frac{1}{\bar{z}_1}, z_2 = \frac{1}{\bar{z}_2}, \dots, z_n = \frac{1}{\bar{z}_n}$$

$$\therefore |z_1 + z_2 + \dots + z_n| = |\overline{z_1 + z_2 + \dots + z_n}|$$

$$= |\overline{z_1} + \overline{z_2} + \dots + \overline{z_n}| = \left| \frac{1}{z_1} + \frac{1}{z_2} + \dots + \frac{1}{z_n} \right|$$

24. (i) (b) Since, $(1+i)z = (1-i)\bar{z}$

$$\Rightarrow \frac{z}{\bar{z}} = \frac{1-i}{1+i} \times \frac{1-i}{1-i} = \frac{(1-i)^2}{1-i^2} = \frac{1+i^2-2i}{1+1} = -i$$

$$\Rightarrow \frac{z}{\bar{z}} = -i\bar{z}$$

(ii) (a) $\because \overline{z_1 z_2} = \bar{z}_1 \bar{z}_2$

$$\begin{aligned} \text{(iii) (a) Let } z &= \frac{(2+i)x-i}{4+i} + \frac{(1-i)y+2i}{4i} \\ &= \frac{2x+(x-1)i}{4+i} + \frac{y+(2-y)i}{4i} \times \frac{i}{i} \\ &= \frac{(2x+(x-1)i)(4-i)}{(4+i)(4-i)} + \frac{-iy+(2-y)}{4} \\ &= \frac{8x+x-1+i(4x-4-2x)}{16+16} + \frac{(2-y)-iy}{4} \end{aligned}$$

17

$$= \frac{9x-1+i(2x-4)}{17} + \frac{2-y-iy}{4}$$

Now, z is real $\Rightarrow \bar{z} = z$

$$\Rightarrow \operatorname{Im} z = 0$$

$$\Rightarrow \frac{2x-4}{17} - \frac{y}{4} = 0$$

$$\Rightarrow 8x-16 = 17y$$

$$\Rightarrow 8x-17y = 16$$

$$\begin{aligned} \text{(iv) (c) } z &= \frac{3+2i\sin\theta}{1-2i\sin\theta} \\ &= \frac{(3+2i\sin\theta)(1+2i\sin\theta)}{1+4\sin^2\theta} \\ &= \frac{(3-4\sin^2\theta)+i(8\sin\theta)}{1+4\sin^2\theta} \end{aligned}$$

Since, z is pure imaginary

$$\Leftrightarrow \operatorname{Re}(z) = 0$$

$$\Leftrightarrow \frac{3-4\sin^2\theta}{1+4\sin^2\theta} = 0$$

$$\Leftrightarrow \sin^2\theta = \frac{3}{4}$$

$$\Rightarrow \sin\theta = \pm \frac{\sqrt{3}}{2}$$

$$\Rightarrow \theta = \frac{\pi}{3} \quad \left(\text{since, } 0 < \theta \leq \frac{\pi}{2} \right)$$

(v) (b) $|z_1 - z_2| = |z_1 + z_2|$

$$\Rightarrow (z_1 - z_2)(\bar{z}_1 - \bar{z}_2) = (z_1 + z_2)(\bar{z}_1 + \bar{z}_2)$$

$$\Rightarrow z_1\bar{z}_2 = -\bar{z}_1z_2$$

$$\Rightarrow \frac{z_1}{z_2} = -\frac{\bar{z}_1}{\bar{z}_2} = -\left(\frac{\bar{z}_1}{z_2}\right)$$

$$\Rightarrow \frac{z_1}{z_2} \text{ is pure imaginary.}$$
