Solution

Section A

1.

(c) 2

Explanation: cosec 150° = cosec $(180^\circ - 30^\circ)$ = cosec 30° = 2.

2.

(c) 2^{mn}

Explanation: We have n(A) = m, n(B) = n.

... Number of relations defined from A to B

= number of possible subsets of A \times B = 2^{n(A \times B)} = 2^{mn}

3.

(b) $\frac{5}{42}$

Explanation: Here, $n(S) = {}^{9}C_{3}$, Let favourable event = E

 \therefore n(E) = ${}^{5}C_{3}$,

Now, P(E) =
$$\frac{n(E)}{n(S)} = \frac{{}^{5}C_{3}}{{}^{9}C_{3}} = \frac{5}{42}$$

4. **(a)** 4/9

Explanation: Given,
$$\lim_{\theta \to 0} \frac{1 - \cos 4\theta}{1 - \cos 6\theta} = \lim_{\theta \to 0} \frac{2 \sin^2 2\theta}{2 \sin^2 3\theta} \left[\because 1 - \cos \theta = 2 \sin^2 \frac{\theta}{2} \right]$$
$$= \lim_{\theta \to 0} \frac{\sin^2 2\theta}{\sin^2 3\theta} = \lim_{\theta \to 0} \left[\frac{\sin 2\theta}{\sin 3\theta} \right]^2$$
$$= \lim_{\theta \to 0} \frac{1}{2\theta} \frac{\sin^2 \theta}{2\theta} \left[\frac{\sin^2 \theta}{2\theta} \times 2\theta}{\frac{\sin^2 \theta}{3\theta} \times 3\theta} \right]^2 = \left[\frac{2\theta}{3\theta} \right]^2 = \left(\frac{2}{3} \right)^2 = \frac{4}{9}$$

5.

(d) $\frac{-1}{10}, \frac{37}{10}$ **Explanation:** Given equation is $y = 3x + 4 \dots (i)$ Since, this equation is in y = mx + b form. Thus, the slope (m_1) of the given equation is 3 Suppose equation of any line passing through the point (2, 3) is $y - y_1 = m(x - x_1)$ \Rightarrow y - 3 = m(x - 2) ...(ii) Given that eq. (i) is perpendicular to eq. (ii) And we know that, if two lines are perpendicular then, $m_1m_2 = -1$ \Rightarrow 3 \times m₂ = -1 \Rightarrow m₂ = $-\frac{1}{3}$ \therefore the slope of the required line $=-\frac{1}{3}$ Substituting the value of slope in eq. (ii), we obtain $y-3=-\tfrac{1}{3}(x-2)$ \Rightarrow 3y - 9 = -x + 2 \Rightarrow x + 3y - 9 - 2 = 0 \Rightarrow x + 3y - 11 = 0 ...(iii) Now, we have to find the coordinates of foot of the perpendicular. Solving eq. (i) and (iii), we obtain x + 3(3x + 4) - 11 = 0 [from(i)] \Rightarrow x + 9x + 12 - 11 = 0

 $\Rightarrow 10x + 1 = 0$ $\Rightarrow x = -\frac{1}{10}$ Substituting the value of x in Eq (i), we obtain $y = 3\left(-\frac{1}{10}\right) + 4$ $\Rightarrow y = -\frac{3}{10} + 4$ $\Rightarrow y = \frac{-3+40}{10}$ $\Rightarrow y = \frac{37}{10}$

So, the required coordinates are $\left(-\frac{1}{10},\frac{37}{10}\right)$

6.

(d) { }

Explanation: { } denoted as null set and Null set is subset of all sets.

7.

(**d**) y ≠ 0

Explanation: If a complex number has to be a non real complex number then its imaginary part should not be zero $\Rightarrow iy \neq 0 \Rightarrow y \neq 0$

8.

(d) {(8,11), (10,13)} Explanation: Since, y = x - 3; Therefore, for x = 11, y = 8. For x = 12, y = 9. [But the value y = 9 does not exist in the given set.] For x = 13, y = 10. So, we have $R = \{(11, 8), (13, 10)\}$ Now, $R^{-1} = \{(8, 11), (10, 13)\}$.

9.

(**d**) 8 ≤ x ≤ 22

Explanation: Let the length of the shortest piece be x cm. Then we have the length of the second and third pieces are x + 3 and 2x centimeters respectively.

According to the question, $x + (x + 3) + 2x \le 91$ $\Rightarrow 4x + 3 \le 91$ $\Rightarrow 4x \le 88$ $\Rightarrow x \le 22$ Also $2x \ge (x + 3) + 5$ $\Rightarrow 2x \ge x + 8$ $\Rightarrow x \ge 8$ $\Rightarrow 8 \le x \le 22$

Hence the shortest piece may be atleast 8 cm long but it cannot be more than 22cm in length.

10.

(b) $\frac{1}{\sqrt{2}}$ Explanation: Using 2 sin A cos A = sin 2A, we get $2 \sin 22 \frac{1}{2}^{\circ} \cos 22 \frac{1}{2}^{\circ} = \sin \left(2 \times \frac{45}{2}\right)^{\circ} = \sin 45^{\circ} = \frac{1}{\sqrt{2}}$

11.

(d) $\left(\frac{S}{R}\right)^n$

Explanation: According to the question, Sum of n terms of the G.P., $S = \frac{a(r^n - 1)}{(r-1)}$ Product of n terms of the G.P., $P = a^n r \left[\frac{n(n-1)}{2}\right]$ Sum of the reciprocals of n terms of the G.P., $R = \frac{\left[\frac{1}{r^n} - 1\right]}{a\left(\frac{1}{r} - 1\right)} = \frac{(r^n - 1)}{ar^{(n-1)}(r-1)}$

$$\therefore P^2 = \left\{ a^2 r^{\frac{2(n-1)}{2}} \right\}^n$$

$$\Rightarrow P^2 = \left\{ \frac{\frac{a(r^n-1)}{(r-1)}}{\frac{(r^n-1)}{ar^{(n-1)}(r-1)}} \right\}^n$$

$$\Rightarrow P^2 = \left\{ \frac{S}{R} \right\}^n$$

Let the first term of the G.P. be a and the common ratio be r. Sum of n terms, $S = \frac{a(r^n-1)}{r-1}$ Product of the G.P., $P = a^n r^{\frac{n(n+1)}{2}}$

(b)
$$\sqrt{2} \tan \beta$$

Explanation: $\cos 2\alpha = \frac{3 \cos 2\beta - 1}{3 - \cos 2\beta}$
 $\Rightarrow \frac{\cos 2\alpha - 1}{\cos 2\alpha + 1} = \frac{(3 \cos 2\beta - 1) - ((3 - \cos 2\beta))}{(3 \cos 2\beta - 1) + ((3 - \cos 2\beta))}$ [Using compounds and dividendo]
 $\Rightarrow \frac{\cos 2\alpha - 1}{\cos 2\alpha} = \frac{4 \cos 2\beta - 4}{2 \cos 2\beta + 2}$
 $\Rightarrow -\frac{1 - \cos 2\alpha}{1 + \cos 2\alpha} = \frac{-4(1 - \cos 2\beta)}{(1 + \cos 2\beta)}$
 $\Rightarrow \frac{1 - \cos 2\alpha}{1 + \cos 2\alpha} = \frac{2(2 \sin^2 \beta)}{(1 + \cos 2\beta)}$
 $\Rightarrow \tan^2 \alpha = 2 \tan^2 \beta$
 $\therefore \tan \alpha = \sqrt{2} \tan \beta$
(c) π
Explanation: π
Given:
 $\frac{3 + 2i \sin \theta}{1 - 2i \sin \theta}$ is a real number
On rationalising, we get,
 $3 + 2i \sin \theta + 1 + 2i \sin \theta$
 $1 - 2i \sin \theta + 1 + 2i \sin \theta$
 $= \frac{(3 + 2i \sin \theta)(1 + 2i \sin \theta)}{1 + 4\sin^2 \theta}$
 $= \frac{3 - 4\sin^2 \theta}{1 + 4\sin^2 \theta} [\because 1^2 = -1]$
 $= \frac{3 - 4\sin^2 \theta}{1 + 4\sin^2 \theta} = 1 + 4\sin^2 \theta$
For the above term to be real, the imaginary part has to be zero.
 $\therefore \frac{8 \sin \theta}{1 + 4\sin^2 \theta} = 0$
 $\Rightarrow 8 \sin \theta = 0$
For this to be zero,
 $\sin \theta = 0$
 $\Rightarrow \theta = 0,$
 $\pi, 2\pi, 3\pi \dots$
But
 $0 < \theta < 2\pi$
Hence,
 $\theta = \pi$

18. **(a)** 72

Explanation: To form an even number the last number can only be an even digit, therefore the number of impossibility for the last digit of number = 3

Now the ten's place can be filled by any of the remaining 4 digits, and hence the no. of ways for ten's place = 4 Then there remain three digits, so no. of ways of filling hundred's place = 3 Similarly no. of ways of filling thousand's place = 2 and of ten thousand = 1 Therefore, the total possibilities are = $3 \times 4 \times 3 \times 2 \times 1 = 72$

(b) Both A and R are true but R is not the correct explanation of A.

Explanation: Assertion:

$$(1 + x)^{n} = n_{c_{0}} + n_{c_{1}}x + n_{c_{2}}x^{2} \dots + n_{c_{n}}x^{n}$$
Reason:

$$(1 + (-1))^{n} = n_{c_{0}}1^{n} + n_{c_{1}}(1)^{n-1}(-1)^{1} + n_{c_{2}}(1)^{n-2}(-1)^{2} + \dots + {}^{n}c_{n}(1)^{n-n}(-1)^{n}$$

$$= n_{c_{8}} - n_{c_{1}} + n_{c_{2}} - n_{c_{3}} + \dots (-1)^{n}n_{c_{n}}$$
Each term will cancel each other

 $(1 + (-1))^n = 0$

Reason is also the but not the correct explanation of Assertion.

20. (a) Both A and R are true and R is the correct explanation of A.

Explanation: Assertion: Let \bar{x} be the mean of $x_1, x_2, ..., x_n$. Then, variance is given by

$$\sigma_1^2 = rac{1}{n}\sum\limits_{i=1}^n \left(x_i - ar{x}
ight)^2$$

If a is added to each observation, the new observations will be

 $y_i = x_i + a$

Let the mean of the new observations be \bar{y} .

$$\begin{split} \bar{y} &= \frac{1}{n} \sum_{i=1}^{n} y_i = \frac{1}{n} \sum_{i=1}^{n} (x_i + a) \\ &= \frac{1}{n} \left[\sum_{i=1}^{n} x_i + \sum_{i=1}^{n} a \right] \\ &= \frac{1}{n} \sum_{i=1}^{n} x_i + \frac{na}{n} = \bar{x} + a \\ &\text{i.e. } \bar{y} = \bar{x} + a \dots \text{(ii)} \end{split}$$

Thus, the variance of the new observations is $\sigma_2^2 = \frac{1}{n} \sum_{i=1}^n (y_i - \bar{y})^2 = \frac{1}{n} \sum_{i=1}^n (x_i + a - \bar{x} - a)^2$ [using Eqs. (i) and (ii)]

$$=rac{1}{n}\sum_{i=1}^{n}(x_{i}-ar{x})^{2}=\sigma_{1}^{2}$$

Thus, the variance of the new observations is same as that of the original observations.

Reason: We may note that adding (or subtracting) a positive number to (or from) each observation of a group does not affect the variance.

We know the square of a real number is never negative.

In addition, f(x) is also undefined when $16 - x^2 = 0$ because denominator will be zero and the result will be indeterminate.

$$16 - x^2 = 0 \Rightarrow x = \pm 4$$

Hence, x ∈ [-4, 4] - {-4, 4}

Thus, the required circle has its centre at C (1, - 2) and radius = 4
Hence, its equation is $(x - 1)^2 + (y + 2)^2 = 4^2$
