

# RD Sharma Class 7 Solutions chapter-20 Mensuration-I Exercise-20.1

## Exercise-20.1.

### Solution 1:-

(i) we have,

$$\text{Length} = 5.5\text{m and, Breadth} = 2.4\text{m}$$

WKT,

$$\text{Area of a rectangle} = \text{Length} \times \text{Breadth.}$$

$$\begin{aligned}\therefore \text{Area of a rectangle} &= 5.5\text{m} \times 2.4\text{m} \\ &= 13.2\text{m}^2\end{aligned}$$

(ii) we have,

$$\text{Length} = 180\text{cm, Breadth} = 150\text{cm}$$

$$\text{we know that, } 1\text{m} = 100\text{cm} \Rightarrow 1\text{cm} = \frac{1}{100}\text{m}$$

$$\text{Length} = 180\text{cm} = 180 \times \frac{1}{100}\text{m} = 1.8\text{m}$$

$$\text{Breadth} = 150\text{cm} = 150 \times \frac{1}{100}\text{m} = 1.5\text{m}$$

$$\begin{aligned}\therefore \text{Area of a rectangle} &= \text{Length} \times \text{Breadth} \\ &= 1.8\text{m} \times 1.5\text{m} \\ &= 2.7\text{m}^2\end{aligned}$$

$$\therefore \text{Area of a rectangle} = 2.7\text{m}^2$$

### Solution-2 :-

(i) we have,

$$\text{side of the square} = 2.6\text{cm}$$

$$\text{we know that, Area of a square} = \text{side} \times \text{side} = (\text{side})^2$$

$$\begin{aligned}\therefore \text{Area of the square} &= 2.6\text{cm} \times 2.6\text{cm} \\ &= 6.76\text{cm}^2\end{aligned}$$

$$\text{Area of the square} = 6.76\text{cm}^2$$

(ii) we have,

$$\text{side of the square} = 1.2\text{dm}$$

$$\text{we know that, } 1\text{dm} = 10\text{cm} \quad [\text{dm} \rightarrow \text{decimeter}]$$

$$\therefore \text{Area of the square} = (\text{side})^2$$

$$\begin{aligned}\text{side of the square} &= 1.2\text{dm} = 1.2 \times 10\text{cm} \\ &= 12\text{cm}\end{aligned}$$

$$\begin{aligned}\therefore \text{Area of the square} &= 12\text{cm} \times 12\text{cm} \\ &= 144\text{cm}^2\end{aligned}$$

Solution-5:-

(i) we have,

$$\text{Length} = 125\text{m}, \text{Breadth} = 400\text{m}.$$

Area of a rectangular field in hectares = ?

we know that,

$$1 \text{ hectare} = 10^4 \text{ m}^2 = 10,000 \text{ m}^2.$$

$$\begin{aligned} \therefore \text{Area of a rectangular field} &= \text{Length} \times \text{Breadth} \\ &= 125\text{m} \times 400\text{m} \\ &= 50,000 \text{ m}^2. \end{aligned}$$

$$1 \text{ m}^2 = \frac{1}{10,000} \text{ hectares}.$$

$$\therefore \text{Area of a rectangular field} = \frac{50,000 \times 1}{10,000} \text{ hectares}.$$

$$\therefore \text{Area of a rectangular field} = 5 \text{ hectares}.$$

$$\begin{aligned} \text{(ii) we have, Length} &= 75\text{m} 5\text{dm} = 75\text{m} + 5 \times 10\text{cm} \\ &= 75\text{m} + 50\text{cm} = 75\text{m} + \frac{50}{100}\text{m} \\ &= 75.5\text{m}. \end{aligned}$$

$$\text{Breadth} = 120\text{m}.$$

$$\begin{aligned} \therefore \text{Area of a rectangular field} &= \text{Length} \times \text{Breadth} \\ &= 75.5\text{m} \times 120\text{m} \\ &= 9060 \text{ m}^2 \end{aligned}$$

$$\text{we know that, } 1 \text{ m}^2 = \frac{1}{10,000} \text{ hectares}.$$

$$\therefore \text{Area of a rectangular field} = \frac{9060}{10,000} \text{ hectares}$$

$$\therefore \text{Area of a rectangular field} = 0.906 \text{ hectares}.$$

Solution-06:-

Given that,

Door of length = 3m and Breadth = 2m.

Wall of Length = 10m and Breadth = 10m.

$$\begin{aligned} \text{Area of Door} &= \text{Length} \times \text{Breadth of door} \\ &= 3\text{m} \times 2\text{m} = 6 \text{ m}^2 \end{aligned}$$

$$\begin{aligned} \text{Area of Wall} &= \text{Length of Wall} \times \text{Breadth of Wall} \\ &= 10\text{m} \times 10\text{m} = 100 \text{ m}^2 \end{aligned}$$

$$\begin{aligned} \text{Area of Painting Wall} &= \text{Area of Wall} - \text{Area of Door} \\ &= 100 \text{ m}^2 - 6 \text{ m}^2 = 94 \text{ m}^2. \end{aligned}$$

$$\text{Cost of Painting Wall} = 94 \times \text{Rs } 2.50$$

$$[\because \text{Cost per sq.m}^2 \text{ painting} = \text{Rs } 2.50]$$

$$\therefore \text{cost of Painting Wall} = 94 \times 2.50 = \text{Rs } 235$$

Solution-07:-

It is given that,

Rectangular Shaped Wire of Length = 40cm and  
Breadth = 22cm.

Given that Perimeter of Rectangle = Perimeter of Square.

[∵ A wire in the shape of Rectangle is bent in square shape].

$$\Rightarrow 2(l+b) = 4(\text{side})$$
$$\Rightarrow 2(40+22) = 4(\text{side}) \Rightarrow 124\text{cm} = 4(\text{side})$$
$$\Rightarrow \text{side} = 31\text{cm}.$$

$$\text{Area of Square} = (31)^2 = 961\text{cm}^2 \quad [\because A = (\text{side})^2]$$

$$\text{Area of Rectangle} = 40 \times 22 = 880\text{cm}^2 \quad [\because A = l \times b]$$

∴ Square Encloses More area.

Solution-08:-

It is given that,

Window, Pane of dimensions Length = 25cm.  
Breadth = 16cm.

$$\therefore \text{Area of Pane} = \text{pane Length} \times \text{pane Breadth}$$
$$= 25\text{cm} \times 16\text{cm}$$
$$= 400\text{cm}^2$$
$$= 0.04\text{m}^2 \quad \left[1\text{cm}^2 = \frac{1}{10,000}\text{m}^2\right]$$
$$= \frac{400}{10,000}\text{m}^2$$
$$= 0.04\text{m}^2.$$

$$\therefore \text{Area of Window} = 12 \times \text{Each pane Area}$$
$$= 12 \times 0.04\text{m}^2 = 0.48\text{m}^2.$$

$$\therefore \text{glass will be required for a window} = 0.48\text{m}^2.$$

Solution-09:-

It is given that,

Marble Length = 10cm and Breadth = 12cm.

Wall of Length = 3m and Breadth = 4m.

$$\therefore \text{Area of Marble tile} = \text{Length of tile} \times \text{Breadth of tile}$$
$$= 10\text{cm} \times 12\text{cm} = 120\text{cm}^2$$
$$= 0.012\text{m}^2 \quad \left[\because \text{cm}^2 = \frac{1}{10,000}\text{m}^2\right]$$

$$\therefore \text{Area of Wall} = 3\text{m} \times 4\text{m} = 12\text{m}^2.$$

$$\therefore \text{No. of tiles required} = \frac{\text{Area of Wall}}{\text{Area of Marble tile}} = \frac{12}{0.012}$$
$$= 1000 \text{ tiles}$$

$$\text{Total cost of the tiles for covering of wall} = 1000 \times 2\text{Rs} = \text{Rs} 2,000.$$

Solution-10:-

Given that,

$$\text{Table Top} = 9\text{ dm } 5\text{ cm} = 9 \times 10\text{ cm} + 5\text{ cm} = 95\text{ cm}.$$

$$\text{Table Long} = 6\text{ dm } 5\text{ cm} = 6 \times 10\text{ cm} + 5\text{ cm} = 65\text{ cm}.$$

$$\begin{aligned}\text{Area of Table} &= \text{Table Top} \times \text{Table Long} \\ &= 95\text{ cm} \times 65\text{ cm} \\ &= 6175\text{ cm}^2.\end{aligned}$$

$$\text{Cost to polish Table} = 6175 \times 20 \text{ paise}$$

$$[\because \text{cost per } 82\text{ cm Polish} = 20 \text{ paise}]$$

$$\begin{aligned}\therefore \text{cost to polish Table} &= 6175 \times 20 \text{ paise} \\ &= \text{RS. } 1235.\end{aligned}$$

$$[\because 1\text{ RS} = 100 \text{ paise}]$$

Solution-11:-

It is Given that,

$$\text{Room Length} = 9.68\text{ m and Breadth (wide)} = 6.2\text{ m}.$$

$$\text{Rectangular tile of Length} = 22\text{ cm}.$$

$$\text{Breadth} = 10\text{ cm}.$$

$$\text{Cost per tile} = \text{Rs } 2.50.$$

$$\text{Area of Room} = 9.68 \times 6.2 \text{ m}^2 = 60.016 \text{ m}^2$$

$$\begin{aligned}\text{Area of Rectangular tile} &= 22\text{ cm} \times 10\text{ cm} = 220\text{ cm}^2 \\ &= 0.022 \text{ m}^2\end{aligned}$$

$$\begin{aligned}\text{No. of tiles} &= \frac{\text{Area of Room}}{\text{Area of Rectangular tile}} = \frac{60.016 \text{ m}^2}{0.022 \text{ m}^2} \\ &= 2728 \text{ tiles}.\end{aligned}$$

$$\therefore \text{Cost of the tiles} = 2728 \times \text{Rs } 2.50 = \text{Rs } 6820$$

Solution-12:-

Given square field of side = 179 m.

$$\begin{aligned}\text{Area of square field} &= 179 \text{ m} \times 179 \text{ m} \\ &= 32041 \text{ m}^2\end{aligned}$$

Cost of Raising a Lawn on the field =

$$\text{Rs } 1.50 \text{ per sq. m.}$$

$$\text{Total cost of Raising of a Lawn on the field} = 32041 \times 1.5$$

$$= \text{Rs } 48,061.50 \text{ Paise}.$$

$$\therefore \text{Total cost} = \text{Rs } 48,061.50.$$

Solution-14:-

Given that,

$$\text{Corridor of a school Length} = 8\text{ m}.$$

$$\text{Breadth} = 6\text{ m}.$$

$$\text{Canvas sheet Length} = 2\text{ m}.$$

$$\text{Breadth} = 1\text{ m}.$$

$$\begin{aligned}\text{Area of a corridor} &= L \times B = 8\text{ m} \times 6\text{ m} \\ &= 48 \text{ m}^2.\end{aligned}$$

$$\text{Canvas sheet Area} = 2\text{ m} \times 1\text{ m} = 2 \text{ m}^2.$$

$$\begin{aligned}\text{No of sheets} &= \frac{\text{Area of corridor}}{\text{Canvas sheet Area}} = \frac{48 \text{ m}^2}{2 \text{ m}^2} \\ &= 24.\end{aligned}$$

$$\begin{aligned}\text{Cost of the canvas sheets req. to cover the} \\ \text{corridor} &= 24 \times \text{Rs. } 8 = \text{Rs. } 192.\end{aligned}$$

Solution-15:-

given  
 Play ground Length =  $62\text{m } 60\text{cm} = 62 + \frac{60 \times 1}{100} \text{m}$   
 $= 62.6\text{m}$   
 Breadth =  $25\text{m } 40\text{cm} = 25 + \frac{40}{100} \text{m}$   
 $= 25.4\text{m}$

Area of a play ground =  $62.6 \times 25.4 = 1590.04 \text{m}^2$

cost of turfing =  $1590.04 \times 2.5 = \text{Rs } 3975$

perimeter of a play ground =  $2(62.6 + 25.4) = 176\text{m}$

Perimeter of 3 times round the field =  $3 \times 176\text{m} = 528\text{m}$   
 And he walks  $2\text{m/sec}$

Time =  $\frac{528}{2} = 264 \text{ seconds} = 4\text{min } 24\text{seconds}$

Solution-16:-

Lane length =  $180\text{m}$  and Breadth =  $5\text{m}$

Bricks of Length =  $20\text{cm}$  and Breadth =  $15\text{cm}$

Area of a Lane =  $180\text{m} \times 5\text{m} = 900\text{m}^2$

Area of a Brick =  $20\text{cm} \times 15\text{cm} = 300\text{cm}^2$   
 $= \frac{300}{10,000} \text{m}^2 = 0.03\text{m}^2$

No. of Bricks =  $\frac{\text{Area of Lane}}{\text{Area of Brick}} = \frac{900}{0.03}$   
 $= 30,000$

Total cost of Bricks =  $30 \times \text{Rs } 750$

$= \text{Rs } 22,500$  [∵ cost per  
 1000 bricks  
 $= \text{Rs } 750$ ]

Solution-17:-

sheet of Paper Length =  $125\text{cm}$  & Breadth =  $85\text{cm}$

piece of Paper of size Length =  $17\text{cm}$  & Breadth =  $5\text{cm}$

sheet of Paper Area =  $125\text{cm} \times 85\text{cm}$

Piece of Paper Area =  $17\text{cm} \times 5\text{cm}$

No. of envelopes =  $\frac{\text{Sheet of Paper Area}}{\text{Piece of Paper Area}}$   
 $= \frac{125\text{cm} \times 85\text{cm}}{17\text{cm} \times 5\text{cm}} = 125\text{cm}$

∴ 125cm of envelopes can be made out of a sheet

Solution-18:-

The width of a cloth =  $170\text{cm}$

Length of a cloth =  $2 = 1$

No. of diapers =  $25$

Piece of cloth Length =  $50\text{cm}$  and

Breadth =  $17\text{cm}$

No. of diapers =  $\frac{\text{Area of a cloth}}{\text{Area of a piece of cloth}}$

$25 = \frac{170\text{cm} \times 1}{50\text{cm} \times 17\text{cm}}$

$\frac{25 \times 50\text{cm}}{10} = 1 \Rightarrow 1 = 125\text{cm}$

Solution 21:-

Given dimensions of a hall

$$\text{length} = 36 \text{ m} = 'l'$$

$$\text{breadth} = 24 \text{ m} = 'b'$$

And also given area of doors and windows =  $80 \text{ m}^2$

Let  $h$  be the height of the hall.

Area of papering the wall

$$= 2lh + 2bh - \{\text{Area of windows and doors}\}$$

$$= (36 \times h + 36 \times h + 24 \times h + 24 \times h - 80) \text{ m}^2$$

$$= 2 \times h \times (36 + 24) - 80$$

$$= (120h - 80) \text{ m}^2$$

$$\therefore \text{Total area of papering} = (120h - 80) \text{ m}^2.$$

We have

$$\text{Cost of papering the walls per } 1 \text{ m}^2 = \text{Rs } 8.40$$

$$\text{Cost of papering the walls} = \text{Rs } 9408.$$

from this, we get

$$\text{Total area of papering (in m}^2\text{)} = \frac{\text{Rs } 9408}{\text{Rs } 8.40}$$

$$= 1120 \text{ m}^2$$

$$\text{But we have, Total area} = (120h - 80) \text{ m}^2$$

$$\therefore 120h - 80 = 1120$$

$$120h = 1200$$

$$\Rightarrow h = \frac{1200}{120} = 10 \text{ m}$$

$$\therefore \text{Height of the hall} = 10 \text{ m}.$$

# chapter-20 Mensuration-I

## Exercise-20.2

Exercise-20.2.

Solution-01:-

Let ABCD be the Grassy Lawn, and Let PQRS be the external boundaries of the path, we have,

Length of AB = 40m.

Breadth of BC = 25m.

$$\begin{aligned} \text{Area of Lawn ABCD} &= 40 \times 25 \text{ m}^2 \\ &= 1000 \text{ m}^2 \end{aligned}$$

Length of PQ =  $(40 + 2 + 2)$  m

Breadth of QR =  $(25 + 2 + 2)$  m

$$\begin{aligned} \therefore \text{Area of PQRS} &= 44 \times 29 \text{ m}^2 \\ &= 1276 \text{ m}^2 \end{aligned}$$

Now,

Area of the path

$$= \text{Area of PQRS} - \text{Area of Lawn}$$

$$= (1276 - 1000) \text{ m}^2$$

$$= 276 \text{ m}^2$$

$$\begin{aligned} \text{Cost of levelling the path} &= 276 \times \text{RS } 825 \\ &= \text{RS } 2277 \end{aligned}$$

Solution-02:-

Let ABCD be the Square Park and Let PQRS be the internal boundaries of the path.

we have,

Length AB = 30m = side AB

Length PQ = 30m - 2m  
= 28m = side PQ

$$\begin{aligned} \text{Area of ABCD} &= 30 \text{ m} \times 30 \text{ m} \\ &= 900 \text{ m}^2 \end{aligned}$$

$$\begin{aligned} \text{Area of PQRS} &= 28 \text{ m} \times 28 \text{ m} \\ &= 784 \text{ m}^2 \end{aligned}$$

$$\text{Total cost} = \text{RS } 1176$$

$$\text{Cost Per sq.m} = \frac{\text{RS } 1176}{\text{Area}}$$

$$= \frac{\text{RS } 1176}{784}$$

$$= \text{RS } 1.5 \text{ per sq.m.}$$

Solution-04:-

Rectangular sheet

$$\text{Length} = 100 \text{ cm}$$

$$\text{Breadth} = 80 \text{ cm}$$

$$\begin{aligned}\text{Area} &= 100 \times 80 \text{ cm}^2 \\ &= 8000 \text{ cm}^2\end{aligned}$$

Square of side = 10 cm

$$\begin{aligned}\text{Area of Square} &= 10 \times 10 \text{ cm}^2 \\ &= 100 \text{ cm}^2\end{aligned}$$

$$\begin{aligned}\text{Area of 4 squares} &= 4 \times 100 \text{ cm}^2 \\ &= 400 \text{ cm}^2\end{aligned}$$

$$\begin{aligned}\text{Area of Remaining sheet} &= \text{Area of rect} - 4 \times \text{Area of sq} \\ &= 8000 \text{ cm}^2 - 400 \text{ cm}^2 = 7600 \text{ cm}^2\end{aligned}$$
