# CBSE Paper 2020 Math Delhi (Set 1)

**General Instructions:**

Read the following instructions very carefully and strictly follow them :

(i) This question paper comprises **four** sections – **A, B, C** and **D.**

This question paper carries **36** questions. **All** questions are compulsory.

(ii) **Section A** – Question no. **1** to **20** comprises of **20** questions of **one** mark each.

(iii) **Section B** – Question no. **21** to **26** comprises of **6** questions of **two** marks each.

(iv) **Section C** – Question no. **27** to **32** comprises of **6** questions of **four** marks each.

(v) **Section D** – Question no. **33** to **36** comprises of **4** questions of **six** marks each.

(vi) There is no overall choice in the question paper. However, an internal choice has been provided in **3** questions of one mark, **2** questions of two marks, **2** questions of four marks and **2** questions of six marks. Only one of the choices in such questions have to be attempted.

(vii) In addition to this, separate instructions are given with each section and question, wherever necessary.

(viii) Use of calculators is not permitted.

**Question 1**

If A is a square matrix of order 3, such that A (adj A) = 10 I, then |adj A| is equal to

(a) 1

(b) 10

(c) 100

(d) 101

**Solution:**

We know that $(adjA)A = |A|I$

Writing determinants on both the sides, we get

$|(adjA)A| = ||A|I|$

$\Rightarrow |10I| = |A|$

$\Rightarrow |A| = |10I| = 10$

Also,

$|adjA| = |A|^{n-1}$

$\Rightarrow |adjA| = |10|^{3-1} = 100$

Hence, the correct answer is option (c).

**Question 2**

If A is a 3 × 3 matrix such that |A| = 8, then |3A| equals.
(a) 8
(b) 24
(c) 72
(d) 216

**Solution:**

Given that $A$ is a $3 \times 3$ matrix and $|A| = 8$.
We know that $\text{If } A = [a_{ij}]_{3\times3} \text{ then } |k.A| = k^3 |A|$
When $k$ = 3, then
$|3.A| = 3^3 |A| = 27|A| = 27 \times 8 = 216$
Hence, the correct answer is option (d).

**Question 3**

If $y = Ae^{5x} + Be^{-5x}$, then $\frac{d^2y}{dx^2}$ is equal to
(a) $25y$
(b) $5y$
(c) $-25y$
(d) $15y$

**Solution:**

Given $y = Ae^{5x} + Be^{-5x}$.
Differentiating both sides w.r.t. $x$, we get
$\frac{\mathrm{d}y}{\mathrm{d}x} = 5Ae^{5x} - 5Be^{-5x}$
$\Rightarrow \frac{\mathrm{d}^2y}{\mathrm{d}x^2} = 25Ae^{5x} + 25Be^{-5x}$
$\Rightarrow \frac{\mathrm{d}^2y}{\mathrm{d}x^2} = 25\left(Ae^{5x} + Be^{-5x}\right) = 25y$
Hence, the correct answer is option (a).

**Question 4**

$\int x^2\, e^{x^3}\, dx$ equals
(a) $\frac{1}{3}\, e^{x^3} + \mathrm{C}$
(b) $\frac{1}{3}\, e^{x^4} + \mathrm{C}$

(c) $\frac{1}{2}\ e^{x^3} + \mathrm{C}$
(d) $\frac{1}{2}\ e^{x^2} + \mathrm{C}$

**Solution:**

The given integral is $I = \int x^2 e^{x^3} dx$.
$\text{Let } x^3 = t$
$\Rightarrow 3x^2 dx = dt$
We get
$I{=}\frac{1}{3}\int e^t dt$
$={\frac{1}{3}}e^t + c \qquad\qquad (\because \int e^t dt = e^t + c)$
$={\frac{1}{3}}e^{x^3} + c$
Hence, the correct answer is option (a).

**Question 5**

If $\hat{i},\ \hat{j},\ \hat{k}$ are unit vectors along three mutually perpendicular directions, then
(a) $\hat{i}\ .\ \hat{j} = 1$
(b) $\hat{i}\ \times\ \hat{j} = 1$
(c) $\hat{i}\ .\ \hat{k} = 0$
(d) $\hat{i}\ \times\ \hat{k} = 0$

**Solution:**

Given three unit vectors $\hat{i},\ \hat{j},\ \hat{k}$ are mutually perpendicular.
Therefore, the angle between them will be right angle.
Consider
$\hat{i}\cdot\hat{k} = \left|\hat{i}\right|\left|\hat{k}\right|\cos 90^\circ = 0$
Hence, the correct answer is option (c).

**Question 6**

ABCD is a rhombus whose diagonals intersect at E. Then $\overrightarrow{\mathrm{EA}} + \overrightarrow{\mathrm{EB}} + \overrightarrow{\mathrm{EC}} + \overrightarrow{\mathrm{ED}}$ equals

(a) $\overrightarrow{0}$

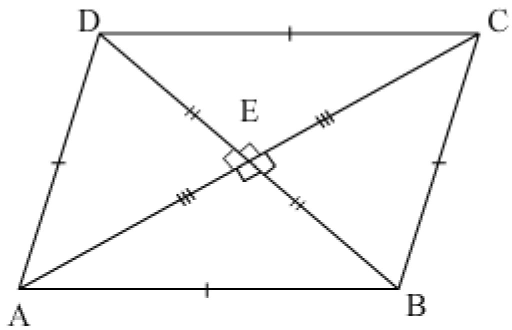
(b) $\overrightarrow{\mathrm{AD}}$

(c) $2\overrightarrow{BC}$

(d) $2\overrightarrow{AD}$

**Solution:**

Given: ABCD is a rhombus and its diagonal intersects at E.



According to the properties of rhombus,

$$\left|\overrightarrow{AB}\right| = \left|\overrightarrow{BC}\right| = \left|\overrightarrow{CD}\right| = \left|\overrightarrow{DA}\right|$$

$$\overrightarrow{EA} = -\overrightarrow{EC}$$

$$\overrightarrow{ED} = -\overrightarrow{EB}$$

Consider the given expression

$$\overrightarrow{EA} + \overrightarrow{EB} + \overrightarrow{EC} + \overrightarrow{ED}$$

$$= -\overrightarrow{EC} + \overrightarrow{EB} + \overrightarrow{EC} - \overrightarrow{EB} \qquad \left(\because \overrightarrow{EA} = -\overrightarrow{EC} \text{ and } \overrightarrow{ED} = -\overrightarrow{EB}\right)$$

$$= 0$$

Hence, the correct answer is option (a).

**Question 7**

The lines $\frac{x-2}{1} = \frac{y-3}{1} = \frac{4-z}{k}$ and $\frac{x-1}{k} = \frac{y-4}{2} = \frac{z-5}{-2}$ are mutually perpendicular if the value of $k$ is

(a) $-\frac{2}{3}$

(b) $\frac{2}{3}$

(c) −2

(d) 2

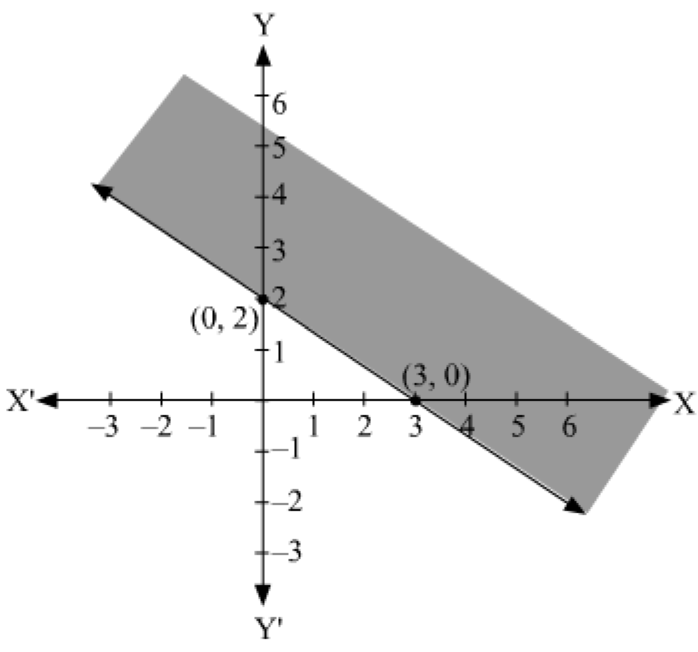
**Solution:**

The given two lines $\frac{x-2}{1}=\frac{y-3}{1}=\frac{4-z}{k}$ and $\frac{x-1}{k}=\frac{y-4}{2}=\frac{z-5}{-2}$ are mutually perpendicular.
Their direction ratios are $(1,\ 1,\ -k)$ and $(k,\ 2,\ -2)$ respectively.
$\Rightarrow 1(k)+1(2)-k(-2)=0$
$\Rightarrow k+2+2k=0$
$\Rightarrow 3k+2=0$
$\Rightarrow k=\frac{-2}{3}$
Hence, the correct answer is option (a).

**Question 8**

The graph of the inequality 2$x$ + 3$y$ > 6 is
(a) half plane that contains the origin.
(b) half plane that neither contains the origin nor the points of the line 2$x$ + 3$y$ = 6.
(c) whole XOY – plane excluding the points on the line 2$x$ + 3$y$ = 6.
(d) entire XOY plane.

**Solution:**



From the graph it can be clearly seen that the graph of the inequality 2$x$ + 3$y$ > 6 is a half plane that neither contains the origin nor the points of the line 2$x$ + 3$y$ = 6.
Hence, the correct answer is option (b).

**Question 9**

A card is picked at random from a pack of 52 playing cards. Given that picked card is a queen, the probability of this card to be a card of spade is

(a) 1/3
(b) 4/13
(c) 1/4
(d) 1/2

**Solution:**

Given that the picked card is a queen.
Therefore,
$\text{Total number of outcomes} = \text{Total number of queens} = 4$
Since only one queen exists of spade.
Therefore,
$\text{Required Probability} = \frac{\text{Total number of favorable outcomes}}{\text{Total outcomes}} = \frac{1}{4}$
Hence, the correct answer is option (c).

**Question 10**

A die is thrown once. Let A be the event that the number obtained is greater than 3. Let B be the event that the number obtained is less than 5. Then P(A∪B) is

(a) 2/5
(b) 3/5
(c) 0
(d) 1

**Solution:**

$A$: Number obtained is greater than 3
$A$ = {4, 5, 6}
$n(A) = 3$
$P(A) = \frac{3}{6}$

$B$: Number obtained is less than 5
$A$ = {1, 2, 3, 4}
$n(A) = 4$
$P(B) = \frac{4}{6}$

$A \cap B$: Number obtained is greater than 3 and less than 5
$A \cap B = \{4\}$
$P(A \cap B) = \frac{1}{6}$

We know
$P(A \cup B) = P(A) + P(B) - P(A \cap B)$
$\Rightarrow P(A \cup B) = \frac{3}{6} + \frac{4}{6} - \frac{1}{6} = 1$
Hence, the correct answer is option (d).

**Question 11**

**Fill in the blank.**
A relation in a set A is called _______ relation, if each element of A is related to itself.

**Solution:**

Every relation in a set *A* is called reflexive relation, if each element of *A* is related to itself.
For example, if *A* = {*p, q, r*} then *R* = {(p,p),(q,q),(r,r),(p,r)} is a reflexive relation.

**Question 12**

If $\mathrm{A} + \mathrm{B} = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix}$ and $\mathrm{A} - 2\mathrm{B} = \begin{bmatrix} -1 & 1 \\ 0 & -1 \end{bmatrix}$, then A = _______.

**Solution:**

Given that
$$A + B = \begin{bmatrix} 1 & 0 \\ 1 & 1 \end{bmatrix} \qquad \ldots\ldots(1)$$
$$\text{and } \mathrm{A} - 2\mathrm{B} = \begin{bmatrix} -1 & 1 \\ 0 & -1 \end{bmatrix} \qquad \ldots\ldots(2)$$
Multiply (1) with 2 and add with (2), we get
$$2A + A = \begin{bmatrix} 2 & 0 \\ 2 & 2 \end{bmatrix} + \begin{bmatrix} -1 & 1 \\ 0 & -1 \end{bmatrix}$$
$$\Rightarrow 3A = \begin{bmatrix} 1 & 1 \\ 2 & 1 \end{bmatrix}$$
$$\Rightarrow A = \frac{1}{3}\begin{bmatrix} 1 & 1 \\ 2 & 1 \end{bmatrix}$$

## Question 13

**Fill in the blank.**

The least value of the function $f\left(x\right)=ax+\frac{b}{x}\ \left(a>0,\ b>0,\ x>0\right)$ is _________.

## Solution:

Given: $f\left(x\right)=ax+\frac{b}{x}\ \left(a>0,\ b>0,\ x>0\right)$

$\text{As } a,\ b \text{ and } x>0$

$\text{We can use AM} \geq \text{GM}$

$\frac{ax+\frac{b}{x}}{2}\geq\sqrt{ax\times\frac{b}{x}}$

$\frac{ax+\frac{b}{x}}{2}\geq\sqrt{ab}$

$ax+\frac{b}{x}\geq2\sqrt{ab}$

$\text{Hence, the minimum value of } f\left(x\right) \text{ is } 2\sqrt{ab}.$

## Question 14

**Fill in the blank.**

The integrating factor of the differential equation $x\frac{dy}{dx}+2y=x^2$ is ________.

**OR**

**Fill in the blank.**

The degree of the differential equation $1+\left(\frac{dy}{dx}\right)^2=x$ is ____________.

## Solution:

The given differential equation is

$x\frac{dy}{dx}+2y=x^2$

$\Rightarrow\frac{dy}{dx}+\left(\frac{2}{x}\right)y=x$

Which is of the form $\frac{dy}{dx}+Py=Q$

Hence, the integrating factor is $e^{\int Pdx}=e^{\int\frac{2}{x}dx}=e^{2\ln x}=e^{\ln x^2}=x^2$

**OR**

The given differential equation is $1+\left(\frac{dy}{dx}\right)^2=x$.

Since the highest order derivative involved in the given differential equation is $\frac{dy}{dx}$ and its power is 2.

So, the degree of the given differential equation is 2.

**Question 15**

**Fill in the blank.**

The vector equation of a line which passes through the points (3, 4, −7) and (1, −1, 6) is ________.

**OR**

**Fill in the blank.**

The line of shortest distance between two skew lines is ______ to both the lines.

**Solution:**

Let the two vectors be $\vec{a} = 3\hat{i} + 4\hat{j} - 7\hat{k}$ and $\vec{b} = \hat{i} - \hat{j} + 6\hat{k}$.

Now, the vector equation of a line passing through two points whose position vectors are $\vec{a}$ and $\vec{b}$ is given by

$$\vec{r} = \vec{a} + \lambda\left(\vec{b} - \vec{a}\right)$$

$$= \left(3\hat{i} + 4\hat{j} - 7\hat{k}\right) + \lambda\left[\left(\hat{i} - \hat{j} + 6\hat{k}\right) - \left(3\hat{i} + 4\hat{j} - 7\hat{k}\right)\right]$$

$$= \left(3\hat{i} + 4\hat{j} - 7\hat{k}\right) + \lambda\left(-2\hat{i} - 5\hat{j} + 13\hat{k}\right)$$

$$= (3 - 2\lambda)\hat{i} + (4 - 5\lambda)\hat{j} + (-7 + 13\lambda)\hat{k}$$

**OR**

The line of shortest distance between two skew lines is perpendicular to both the lines.

**Question 16**

Find the value of $\sin^{-1}\left[\sin\left(-\frac{17\pi}{8}\right)\right]$.

**Solution:**

Consider the given expression

$$\sin^{-1}\left[\sin\left(-\frac{17\pi}{8}\right)\right] = \sin^{-1}\left(-\sin\frac{17\pi}{8}\right)$$

$$= \sin^{-1}\left[-\sin\left(2\pi + \frac{\pi}{8}\right)\right]$$

$$= \sin^{-1}\left(-\sin\frac{\pi}{8}\right)$$

$$= \sin^{-1}\left[\sin\left(-\frac{\pi}{8}\right)\right]$$

$$= -\frac{\pi}{8}$$

**Question 17**

For $A = \begin{bmatrix} 3 & -4 \\ 1 & -1 \end{bmatrix}$ write $A^{-1}$.

**Solution:**

Given $A=\begin{bmatrix}3 & -4\\ 1 & -1\end{bmatrix}$

$|A|=\begin{vmatrix}3 & -4\\ 1 & -1\end{vmatrix}=1\neq 0$

This implies that the given matrix is invertible.

Also, $adjA=\begin{bmatrix}-1 & -1\\ 4 & 3\end{bmatrix}'=\begin{bmatrix}-1 & 4\\ -1 & 3\end{bmatrix}$

$\therefore A^{-1}=\frac{adjA}{|A|}=\begin{bmatrix}-1 & 4\\ -1 & 3\end{bmatrix}$

**Question 18**

If the function *f* defined as

$$f(x)=\begin{cases}\frac{x^2-9}{x-3}, & x\neq 3\\ k, & x=3\end{cases}$$

is continuous at $x = 3$, find the value of $k$.

**Solution:**

The function is defined as $f(x)=\begin{cases}\frac{x^2-9}{x-3}, \ x\neq 3\\ k, \ x=3\end{cases}$

This function is given to be continuous at $x = 3$.

$\Rightarrow \lim\limits_{x\to 3^+} f(x)=f(3)$

$\Rightarrow \lim\limits_{x\to 3^+}\left[\frac{x^2-9}{x-3}\right]=k$

$\Rightarrow \lim\limits_{x\to 3^+}\left[\frac{(x-3)(x+3)}{x-3}\right]=k$

$\Rightarrow \lim\limits_{x\to 3^+}(x+3)=k$

$\Rightarrow 3+3=k$

$\Rightarrow k=6$

**Question 19**

If $f(x) = x^4 - 10$, then find the approximate value of $f(2.1)$.

**OR**

Find the slope of the tangent to the curve $y = 2\sin^2(3x)$ at $x = \pi/6$.

**Solution:**

Given: $y = f(x) = x^4 - 10$

$\therefore \frac{dy}{dx} = 4x^3$

We need to find f(2.1)

Let $x = 2$ and $\Delta x = 0.1$

Therefore, $\Delta y = f(x + \Delta x) - f(x)$

$= f(2.1) - f(2)$

$= f(2.1) - (2^4 - 10)$

$= f(2.1) - 6$

$\Rightarrow f(2.1) = \Delta y + 6$ .....(1)

Now, $\Delta y = \frac{dy}{dx}\Delta x = 4(2)^3 \times (0.1) = 32 \times (0.1) = 3.2$

From (1),

$f(2.1) = 3.2 + 6 = 9.2$

Hence, the approximate value of f(2.1) using derivative is 9.2.

**OR**

Given curve is $y = 2\sin^2(3x)$

Therefore, $\frac{dy}{dx} = 12\sin(3x)\cos(3x) = 6\sin(6x)$

At $x = \frac{\pi}{6}$, $\frac{dy}{dx} = 6\sin\pi = 0$

Hence, the slope of the tangent at $x = \frac{\pi}{6}$ is 0.

**Question 20**

Find the value of $\int_1^4 |x-5|dx$.

**Solution:**

$I = \int_1^4 |x-5|dx$

$I = \int_1^4 -(x-5)dx$

$I = \int_1^4 (5 - x)dx$

$I = \left[5x - \frac{x^2}{2}\right]_1^4$

$I = \left(5 \times 4 - \frac{4^2}{2}\right) - \left(5 \times 1 - \frac{1^2}{2}\right)$

$I = 12 - \frac{9}{2} = \frac{15}{2}$

**Question 21**

If $f(x)=\frac{4x+3}{6x-4},\ x\neq\frac{2}{3}$, then show that (*fof*) (*x*) = *x*, for all $x\neq\frac{2}{3}$. Also, write inverse of *f*.

**OR**

Check if the relation *R* in the set $\mathbb{R}$ of real numbers defined as *R* = {(*a*, *b*) : *a* < *b*} is (i) symmetric, (ii) transitive

**Solution:**

Given, $f\left(x\right)=\frac{4x+3}{6x-4},\ x\neq\frac{2}{3}$

$$(fof)(x)=\frac{4\left(\frac{4x+3}{6x-4}\right)+3}{6\left(\frac{4x+3}{6x-4}\right)-4}$$

$$\Rightarrow (fof)(x)=\frac{\frac{16x+12+18x-12}{6x-4}}{\frac{24x+18-24x+16}{6x-4}}$$

$$\Rightarrow (fof)(x)=\frac{34x}{34}=x$$

Hence proved.

To find inverse of the given function,

Let $y=\frac{4x+3}{6x-4}$

$\Rightarrow y(6x-4)=4x+3$

$\Rightarrow 6xy-4y=4x+3$

$\Rightarrow 6xy-4x=3+4y$

$\Rightarrow x(6y-4)=4y+3$

$\Rightarrow x=\frac{4y+3}{6y-4}$

Therefore, $f^{-1}(x)=\frac{4x+3}{6x-4},\ x\neq\frac{2}{3}$

**OR**

We have,

$R=\{(a,\ b)\ :\ a<b\},\quad \text{where } a,\ b\in\mathbb{R}$

(i) Symmetry

We observe that $(2,\ 3)\in R$ but $(3,\ 2)\notin R$.

So, *R* is not symmetric.

(ii) Transitivity

Let $(a,\ b)\in R$ and $(b,\ c)\in R$. Then,

$\Rightarrow a < b$ and $b < c$
$\Rightarrow a < c$
$\Rightarrow (a, c) \in R$
So, $R$ is transitive.

## Question 22

Find $\int \frac{x}{x^2+3x+2} dx.$

## Solution:

Given integral is $\int \frac{x}{x^2+3x+2} \mathrm{d}x$.

$$\Rightarrow \frac{1}{2} \int \frac{(2x+3)-3}{x^2+3x+2} \mathrm{d}x$$

$$\Rightarrow \frac{1}{2} \left[ \int \frac{(2x+3)}{x^2+3x+2} \mathrm{d}x - 3 \int \frac{1}{(x+1)(x+2)} \mathrm{d}x \right]$$

$$\Rightarrow \frac{1}{2} \left[ \log\left(x^2+3x+2\right) - 3 \int \left\{ \frac{1}{(x+1)} - \frac{1}{(x+2)} \right\} \mathrm{d}x \right]$$

$$\Rightarrow \frac{1}{2} \log\left(x^2+3x+2\right) - \frac{3}{2} \left[ \log(x+1) - \log(x+2) \right] + c$$

$$\Rightarrow \frac{1}{2} \log\left(x^2+3x+2\right) - \frac{3}{2} \log\left(\frac{x+1}{x+1}\right) + c$$

$$\Rightarrow \log \sqrt{x^2+3x+2} - 3 \log \sqrt{\frac{x+1}{x+1}} + c$$

## Question 23

If $x = a \cos \theta$; $y = b \sin \theta$, then find $\frac{d^2y}{dx^2}$.

Find the differential of $\sin^2 x$ w.r.t. $e^{\cos x}$.

## Solution:

Given $x = a\cos\theta,\ y = b\sin\theta$
Differentiating w.r.t. $\theta$, we get

$$\frac{dx}{d\theta} = -a\sin\theta,\ \frac{dy}{d\theta} = b\cos\theta$$

$$\Rightarrow \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{b\cos\theta}{-a\sin\theta} = \frac{-b}{a}\cot\theta$$

Differentiating w.r.t. *x*, we get

$$\frac{d^2y}{dx^2} = \frac{b \operatorname{cosec}^2 \theta}{a} \ \frac{d\theta}{dx}$$

$$= \frac{b \operatorname{cosec}^2 \theta}{a} \left(\frac{-1}{a \sin \theta}\right)$$

$$= \frac{-b \operatorname{cosec}^3 \theta}{a^2}$$

**OR**

Let $y = \sin^2 x,\ z = e^{\cos x}$

Differentiating both the functions w.r.t. *x*, we get

$$\frac{dy}{dx} = 2 \sin x \cos x,\ \frac{dz}{dx} = e^{\cos x}(-\sin x)$$

$$\Rightarrow \frac{dy}{dz} = \frac{\frac{dy}{dx}}{\frac{dz}{dx}} = \frac{2 \sin x \cos x}{e^{\cos x}(-\sin x)} = \frac{-2 \cos x}{e^{\cos x}}$$

## Question 24

Evaluate $\int_1^2 \left[\frac{1}{x} - \frac{1}{2x^2}\right] e^{2x}\ dx$.

## Solution:

$$\int_1^2 \left(\frac{1}{x} - \frac{1}{2x^2}\right) e^{2x} dx$$

Let $2x = t \Rightarrow 2dx = dt$

When $x = 1$, $t = 2$ and when $x = 2$, $t = 4$

$$\therefore \int_1^2 \left(\frac{1}{x} - \frac{1}{2x^2}\right) e^{2x} dx = \frac{1}{2} \int_2^4 \left(\frac{2}{t} - \frac{2}{t^2}\right) e^t dt$$

$$= \int_2^4 \left(\frac{1}{t} - \frac{1}{t^2}\right) e^t dt$$

Let $\frac{1}{t} = f(t)$

Then, $f'(t) = -\frac{1}{t^2}$

$$\Rightarrow \int_2^4 \left(\frac{1}{t} - \frac{1}{t^2}\right) e^t dt = \int_2^4 e^t \left[f(t) + f'(t)\right] dt$$

$$= \left[e^t f(t)\right]_2^4$$

$$= \left[\frac{e^t}{t}\right]_2^4$$

$$= \frac{e^4}{4} - \frac{e^2}{2}$$

$$= \frac{e^2\left(e^2 - 2\right)}{4}$$

**Question 25**

Find the value of $\int\limits_0^1 x(1-x)^n\,dx$.

**Solution:**

The given integral is $\int_0^1 x(1-x)^n\,\mathrm{d}x$

Put $1-x=t$ so that $\mathrm{d}x=-\mathrm{d}t$

$\Rightarrow t=1$ when $x=0$, $t=0$ when $x=1$

$\Rightarrow -\int_1^0 (1-t)t^n\,\mathrm{d}t$

$\Rightarrow -\int_1^0 \left(t^n-t^{n+1}\right)\mathrm{d}t$

$\Rightarrow \int_0^1 \left(t^n-t^{n+1}\right)\mathrm{d}t$

$\Rightarrow \left[\frac{t^{n+1}}{n+1}-\frac{t^{n+2}}{n+2}\right]_0^1$

$\Rightarrow \left[\frac{(1)^{n+1}}{n+1}-\frac{(1)^{n+2}}{n+2}\right]-\left[\frac{(0)^{n+1}}{n+1}-\frac{(0)^{n+2}}{n+2}\right]$

$\Rightarrow \left[\frac{1}{n+1}-\frac{1}{n+2}\right]$

$\Rightarrow \frac{1}{(n+1)(n+2)}$

**Question 26**

Given two independent events A and B such that P(A) = 0.3 and P(B) = 0.6, find P(A′ ∩ B′)

**Solution:**

It is given that P (A) = 0.3 and P (B) = 0.6
Also, A and B are independent events.

$\therefore \mathrm{P}(\mathrm{A \text{ and } B})=\mathrm{P}(\mathrm{A})\cdot\mathrm{P}(\mathrm{B})$

$\Rightarrow \mathrm{P}(\mathrm{A}\cap\mathrm{B})=0.3\times0.6=0.18$

And, $\mathrm{P}(\mathrm{A}\cup\mathrm{B})$

$=\mathrm{P}(\mathrm{A})+\mathrm{P}(\mathrm{B})-\mathrm{P}(\mathrm{A}\cap\mathrm{B})$

$=0.3+0.6-0.18$

$=0.72$

So, $\mathrm{P}(\mathrm{A}'\cap\mathrm{B}')$

$=\mathrm{P}\left((\mathrm{A}\cup\mathrm{B})'\right)$

$=1-\mathrm{P}(\mathrm{A}\cup\mathrm{B})$

$=1-0.72$

$=0.28$

## Question 27

Solve for $x$ : $\sin^{-1}(1-x) - 2\ \sin^{-1}(x) = \frac{\pi}{2}$.

## Solution:

Given equation is $\sin^{-1}(1-x) - 2\sin^{-1}(x) = \frac{\pi}{2}$.

$\Rightarrow \sin^{-1}(1-x) = \frac{\pi}{2} + 2\sin^{-1}(x)$

$\Rightarrow 1-x = \sin\left[\frac{\pi}{2} + 2\sin^{-1}(x)\right]$

$\Rightarrow 1-x = \cos\left[2\sin^{-1}(x)\right]$

$\text{Put } \sin^{-1}(x) = t \text{ so that } \sin t = x$

$\Rightarrow 1-x = \cos 2t$

$\Rightarrow 1-x = 1-2\sin^2 t$

$\Rightarrow 1-x = 1-2x^2$

$\Rightarrow x(2x-1) = 0$

$\Rightarrow x = 0 \text{ or } x = \frac{1}{2}$

But only $x = 0$ satisfies the given equation.
Hence, the value of $x$ is zero.

## Question 28

If $y = (\log\ x)^x + x^{\log x}$, then find $\frac{dy}{dx}$.

## Solution:

$\text{Given : } y = (\log x)^x + x^{\log x}$

$\text{Also, let } u = (\log x)^x \text{ and } v = x^{\log x}$

$\therefore y = u + v$

$\Rightarrow \frac{dy}{dx} = \frac{du}{dx} + \frac{dv}{dx} \qquad .....(1)$

$\text{Now, } u = (\log x)^x$

$\Rightarrow \log u = \log\left[(\log x)^x\right]$

$\Rightarrow \log u = x\log(\log x)$

Differentiating both sides with respect to $x$,

$\frac{1}{u}\frac{du}{dx} = \log(\log x)\frac{d}{dx}(x) + x\frac{d}{dx}\left[\log(\log x)\right]$

$$\Rightarrow \frac{du}{dx} = u\left[\log(\log x) + x\frac{1}{\log x}\frac{d}{dx}(\log x)\right]$$
$$\Rightarrow \frac{du}{dx} = (\log x)^x\left[\log(\log x) + \frac{x}{\log x} \times \frac{1}{x}\right]$$
$$\Rightarrow \frac{du}{dx} = (\log x)^x\left[\log(\log x) + \frac{1}{\log x}\right] \qquad \ldots\ldots(2)$$
$$\text{Also,} \quad v = x^{\log x}$$
$$\Rightarrow \log v = \log x^{\log x}$$
$$\Rightarrow \log v = \log x \ \log x = (\log x)^2$$

Differentiating both sides with respect to *x*,

$$\frac{1}{v}\frac{dv}{dx} = \frac{d}{dx}\left[(\log x)^2\right]$$
$$\Rightarrow \frac{1}{v}\frac{dv}{dx} = 2(\log x)\frac{d}{dx}(\log x)$$
$$\Rightarrow \frac{dv}{dx} = 2v(\log x)\frac{1}{x}$$
$$\Rightarrow \frac{dv}{dx} = 2x^{\log x}\frac{\log x}{x} \qquad \ldots\ldots(3)$$
$$\text{From } (1),(2) \text{ and } (3), \text{ we obtain}$$
$$\frac{dy}{dx} = 2x^{\log x}\frac{\log x}{x} + (\log x)^x\left[\log(\log x) + \frac{1}{\log x}\right]$$

**Question 29**

Solve the differential equation:

$$x \sin\left(\frac{y}{x}\right)\frac{dy}{dx} + x - y \sin\left(\frac{y}{x}\right) = 0$$

Given that $x = 1$ when $y = \frac{\pi}{2}$.

**Solution:**

The given differential equation is $x\sin\left(\frac{y}{x}\right)\frac{dy}{dx} + x - y\sin\left(\frac{y}{x}\right) = 0$.

$$\Rightarrow \frac{dy}{dx} = \frac{y}{x} - \frac{1}{\sin\left(\frac{y}{x}\right)} \qquad \ldots\ldots(1)$$
$$\text{Put } \frac{y}{x} = v \text{ i.e. } y = vx$$
$$\Rightarrow \frac{dy}{dx} = v + x\frac{dv}{dx}$$

From (1), we have

$$\Rightarrow v + x\frac{dv}{dx} = v - \frac{1}{\sin v}$$
$$\Rightarrow x\frac{dv}{dx} = -\frac{1}{\sin v}$$

$\Rightarrow \sin v \, \mathrm{d} v = -\frac{\mathrm{d} x}{x}$

$\Rightarrow \int \sin v \, \mathrm{d} v = -\int \frac{\mathrm{d} x}{x}$

$\Rightarrow -\cos v = -\log x - c$

$\Rightarrow \cos v = \log x + c$

$\Rightarrow \cos\left(\frac{y}{x}\right) = \log x + c \qquad \ldots\ldots(2)$

At $x = 1$ and $y = \frac{\pi}{2}$, (2) becomes

$\cos\left(\frac{\pi}{2}\right) = \log(1) + c$

$\Rightarrow 0 = 0 + c$

$\Rightarrow c = 0$

Thus, (2) reduces to $\cos\left(\frac{y}{x}\right) = \log x$.

**Question 30**

If $\vec{a} = \hat{i} + 2\hat{j} + 3\hat{k}$ and $\vec{b} = 2\hat{i} + 4\hat{j} - 5\hat{k}$ represent two adjacent sides of a parallelogram, find unit vectors parallel to the diagonals of the parallelogram.

**OR**

Using vectors, find the area of the triangle ABC with vertices A(1, 2, 3), B(2, −1, 4) and C(4, 5, −1).

**Solution:**

Given, $\vec{a} = \hat{i} + 2\hat{j} + 3\hat{k}$ and $\vec{b} = 2\hat{i} + 4\hat{j} - 5\hat{k}$ represent two adjacent sides of a parallelogram.

Then, $\left(\vec{a} + \vec{b}\right)$ and $\left(\vec{a} - \vec{b}\right)$ represent diagonals of the parallelogram.

$\left(\vec{a} + \vec{b}\right) = \left(\hat{i} + 2\hat{j} + 3\hat{k}\right) + \left(2\hat{i} + 4\hat{j} - 5\hat{k}\right) = 3\hat{i} + 6\hat{j} - 2\hat{k}$ and

$\left(\vec{a} - \vec{b}\right) = \left(\hat{i} + 2\hat{j} + 3\hat{k}\right) - \left(2\hat{i} + 4\hat{j} - 5\hat{k}\right) = -\hat{i} - 2\hat{j} + 8\hat{k}$

$\left|\vec{a} + \vec{b}\right| = \sqrt{3^2 + 6^2 + (-2)^2} = 7$ and $\left|\vec{a} - \vec{b}\right| = \sqrt{(-1)^2 + (-2)^2 + (8)^2} = \sqrt{69}$

Let $\vec{c}$ and $\vec{d}$ be the unit vectors parallel to the diagonals of the parallelogram respectively.

Then, $\vec{c} = \frac{\left(\vec{a} + \vec{b}\right)}{\left|\vec{a} + \vec{b}\right|}$ and $\vec{c} = \frac{\left(\vec{a} - \vec{b}\right)}{\left|\vec{a} - \vec{b}\right|}$

$\Rightarrow \vec{c} = \frac{3\hat{i} + 6\hat{j} - 2\hat{k}}{7}$ and $\vec{d} = \frac{-\hat{i} - 2\hat{j} + 8\hat{k}}{\sqrt{69}}$

**OR**

Given, $A(1,\ 2,\ 3),\ B(2,\ -1,4)$ and $C(4,\ 5,\ -1)$ are the vertices of triangle $ABC$.

Then, $\overrightarrow{AB}=(2-1)\hat{i}+(-1-2)\hat{j}+(4-3)\hat{k}=\hat{i}-3\hat{j}+\hat{k}$ and $\overrightarrow{AC}=(4-1)\hat{i}+(5-2)\hat{j}+(-1-3)\hat{k}=3\hat{i}+3\hat{j}-4\hat{k}$

Area of $\Delta ABC=\frac{1}{2}\left|\overrightarrow{AB}\times\overrightarrow{AC}\right|$

$$=\frac{1}{2}\begin{vmatrix}\hat{i} & \hat{j} & \hat{k}\\ 1 & -3 & 1\\ 3 & 3 & -4\end{vmatrix}$$

$$=\frac{1}{2}\left|(12-3)\hat{i}-(-4-3)\hat{j}+(3+9)\hat{k}\right|$$

$$=\frac{1}{2}\left|9\hat{i}+7\hat{j}+12\hat{k}\right|$$

$$=\frac{1}{2}\sqrt{9^2+7^2+12^2}$$

$$=\frac{1}{2}\sqrt{274}\text{ sq. units}$$

**Question 31**

A company manufactures two types of novelty souvenirs made of plywood. Souvenirs of type A requires 5 minutes each for cutting and 10 minutes each for assembling. Souvenirs of type B require 8 minutes each for cutting and and 8 minutes each for assembling. Given that total time for cutting is 3 hours 20 minutes and for assembling 4 hours. The profit for type A souvenir is ₹ 100 each and for type B souvenir, profit is ₹ 120 each. How many souvenirs of each type should the company manufacture in order to maximize the profit? Formulate the problem as an LPP and solve it graphically.

**Solution:**

Let the company manufacture *x* souvenirs of type *A* and *y* souvenirs of type *B*.
Number of items cannot be negative.

Therefore,
$x \geq 0$ and $y \geq 0$
The given information can be complied in a table as follows.

| | Type *A* | Type *B* | Availability |
|---|---|---|---|
| Cutting(min) | 5 | 8 | 3 × 60 + 20 = 200 |
| Assembling(min) | 10 | 8 | 4 × 60 = 240 |

Therefore, the constraints are

$$5x+8y\leq 200$$
$$10x+8y\leq 240$$

The profit on type *A* souvenirs is 100 rupees each and on type *B* souvenirs is 120 rupees each. Therefore, profit gained on *x* souvenirs of type *A* and *y* souvenirs of type *B* is Rs 100*x* and Rs 120*y* respectively.

Total profit, Z = 100*x* + 120*y*

The mathematical formulation of the given problem is
Maximize Z = 100$x$ + 120$y$

subject to the constraints,

$5x + 8y \leq 200$
$10x + 8y \leq 240$
$x \geq 0$ and $y \geq 0$

First we will convert inequations into equations as follows:
5$x$ + 8$y$ = 200, 10$x$ + 8$y$ = 240, $x$ = 0 and $y$ = 0

Region represented by 5$x$ + 8$y$ ≤ 200:
The line 5$x$ + 8$y$ = 200 meets the coordinate axes at $A_1$(40, 0) and $B_1$(0, 25) respectively.

By joining these points we obtain the line 5$x$ + 8$y$ = 200. Clearly (0,0) satisfies the 5$x$ + 8$y$ = 200. So, the region which contains the origin represents the solution set of the inequation 5$x$ + 8$y$ ≤ 200.

Region represented by 10$x$ + 8$y$ ≤ 240:

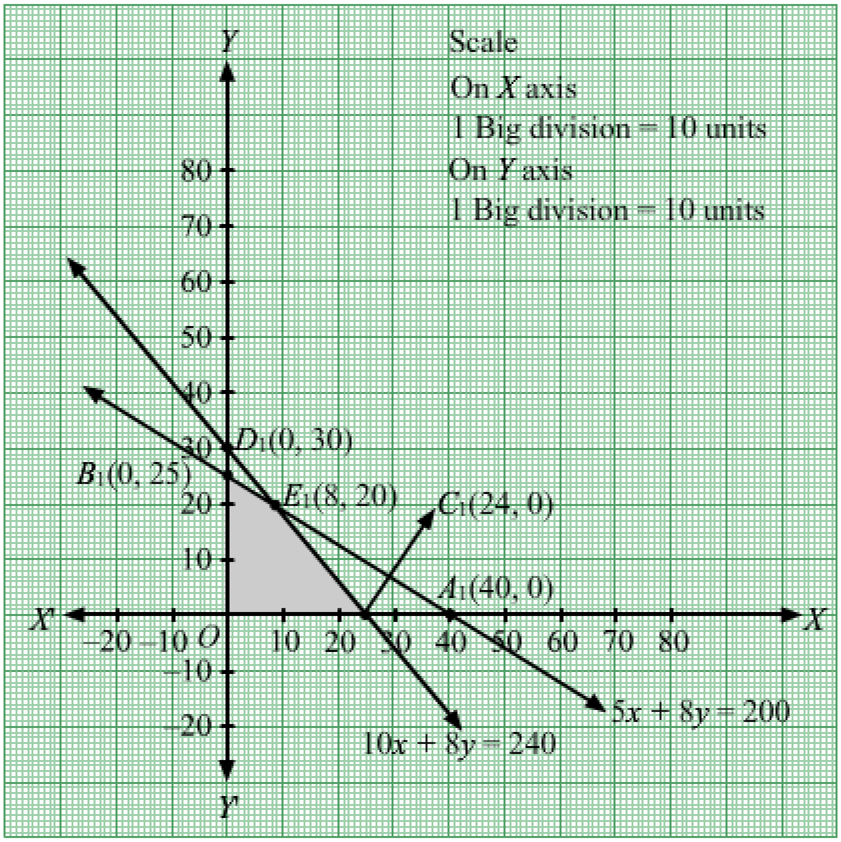
The line 10$x$ + 8$y$ = 240 meets the coordinate axes at $C_1$(24, 0) and $D_1$(0, 30) respectively. By joining these points we obtain the line

10$x$ + 8$y$ = 240. Clearly (0,0) satisfies the inequation 10$x$ + 8$y$ ≤ 240. So, the region which contains the origin represents the solution set of the inequation 10$x$ + 8$y$ ≤ 240.

Region represented by $x$ ≥ 0 and $y$ ≥ 0:

Since, every point in the first quadrant satisfies these inequations. So, the first quadrant is the region represented by the inequations $x$ ≥ 0, and $y$ ≥ 0.

The feasible region determined by the system of constraints 5$x$ + 8$y$ ≤ 200, 10$x$ + 8$y$ ≤ 240, $x$ ≥ 0 and $y$ ≥ 0 are as follows.



The corner points of the feasible region are $O(0, 0)$, $B_1(0, 25)$, $E_1(8, 20)$, $C_1(24, 0)$.
The values of Z at these corner points are as follows.

| Corner point | $Z = 100x + 120y$ |
|---|---|
| $O(0,0)$ | 0 |
| $B_1(0,25)$ | 3000 |
| $E_1(8,20)$ | 3200 |
| $C_1(24, 0)$ | 2400 |

The maximum value of Z is 3200 at $E_1(8,20)$.

Thus, 8 souvenirs of type *A* and 20 souvenirs of type *B* should be produced each day to get the maximum profit of Rs 3200.

**Question 32**

Three rotten apples are mixed with seven fresh apples. Find the probability distribution of the number of rotten apples, if three apples are drawn one by one with replacement. Find the mean of the number of rotten apples.

**OR**

In a shop X, 30 tins of ghee of type A and 40 tins of ghee of type B which look alike, are kept for sale. While in shop Y, similar 50 tins of ghee of type A and 60 tins of ghee of type B are there. One tin of ghee is purchased from one of the randomly selected shop and is found to be of type B. Find the probability that it is purchased from shop Y.

**Solution:**

Let *X* represents number of rotten apples.

Therefore, *X* = 0, 1, 2, 3

P(X = 0) = $\frac{7}{10} \times \frac{7}{10} \times \frac{7}{10} = \frac{343}{1000}$

P(X = 1) = ${}^{3}C_{1} \times \frac{3}{10} \times \frac{7}{10} \times \frac{7}{10} = 3 \times \frac{147}{1000} = \frac{441}{1000}$

P(X = 2) = ${}^{3}C_{2} \times \frac{3}{10} \times \frac{3}{10} \times \frac{7}{10} = 3 \times \frac{63}{1000} = \frac{189}{1000}$

P(X = 3) = ${}^{3}C_{3} \times \frac{3}{10} \times \frac{3}{10} \times \frac{3}{10} = \frac{27}{1000}$

Hence, the required probability distribution is as follows:

| *X* | 0 | 1 | 2 | 3 |
|---|---|---|---|---|
| P(*X*) | $\frac{343}{1000}$ | $\frac{441}{1000}$ | $\frac{189}{1000}$ | $\frac{27}{1000}$ |

Mean of probability distribution = $0 \times \frac{343}{1000} + 1 \times \frac{441}{1000} + 2 \times \frac{189}{1000} + 3 \times \frac{27}{1000}$

$= \frac{441}{1000} + \frac{378}{1000} + \frac{81}{1000} = \frac{900}{1000} = \frac{9}{10}$

Hence, the required mean is $\frac{9}{10}$.

**OR**

Given:

| | Shop *X* | Shop *Y* |
|---|---|---|
| Ghee of type A | 30 tins | 50 tins |
| Ghee of type B | 40 tins | 60 tins |

We have $P(X) = \frac{1}{2}, P(Y) = \frac{1}{2}, P\left({}^{B}/_{X}\right) = \frac{40}{70} = \frac{4}{7}$ and $P\left({}^{B}/_{Y}\right) = \frac{60}{110} = \frac{6}{11}$

Therefore, $P\left({}^{Y}/_{B}\right) = \frac{P(Y \cap B)}{P(B)}$

$= \frac{P(Y) \cdot P\left({}^{B}/_{Y}\right)}{P(Y) \cdot P\left({}^{B}/_{Y}\right) + P(X) \cdot P\left({}^{B}/_{X}\right)}$

$= \frac{\frac{1}{2} \times \frac{6}{11}}{\frac{1}{2} \times \frac{6}{11} + \frac{1}{2} \times \frac{4}{7}}$

$= \frac{\frac{3}{11}}{\frac{3}{11} + \frac{2}{7}}$

$= \frac{3}{11} \times \frac{77}{43} = \frac{21}{43}$

Hence, the probability that the ghee was purchased from shop *Y* is $\frac{21}{43}$.

**Question 33**

Find the vector and cartesian equations of the line which perpendicular to the lines with equations

$$\frac{x+2}{1}=\frac{y-3}{2}=\frac{z+1}{4} \text{ and } \frac{x-1}{2}=\frac{y-2}{3}=\frac{z-3}{4}$$

and passes through the point (1, 1, 1). Also find the angle between the given lines.

**Solution:**

The given two equations are $\frac{x+2}{1}=\frac{y-3}{2}=\frac{z+1}{4}$ and $\frac{x-1}{2}=\frac{y-2}{3}=\frac{z-3}{4}$.
The direction ratios of these lines are $(1,\ 2,\ 4)$ and $(2,\ 3,\ 4)$ respectively.

The direction ratio of the line which is perpendicular to both these lines is given by their cross product i.e. $\begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & 4 \\ 2 & 3 & 4 \end{vmatrix} = -4\hat{i}+4\hat{j}-\hat{k}$.

Now the equation of perpendicular passing through the point (1, 1, 1) and having direction ratios $-4\hat{i}+4\hat{j}-\hat{k}$ is given by
$\vec{r}=\left(\hat{i}+\hat{j}+\hat{k}\right)+\lambda\left(-4\hat{i}+4\hat{j}-\hat{k}\right)$

Its cartesian equation is given by $\frac{x-1}{-4}=\frac{y-1}{4}=\frac{z-1}{-1}$ or $\frac{1-x}{4}=\frac{y-1}{4}=\frac{1-z}{1}$.

Now, the angle between two given lines is given by
$\cos\theta=\left|\frac{1\times2+2\times3+4\times4}{\sqrt{1^2+2^2+4^2}\times\sqrt{2^2+3^2+4^2}}\right|=\frac{24}{\sqrt{21}\sqrt{29}}$

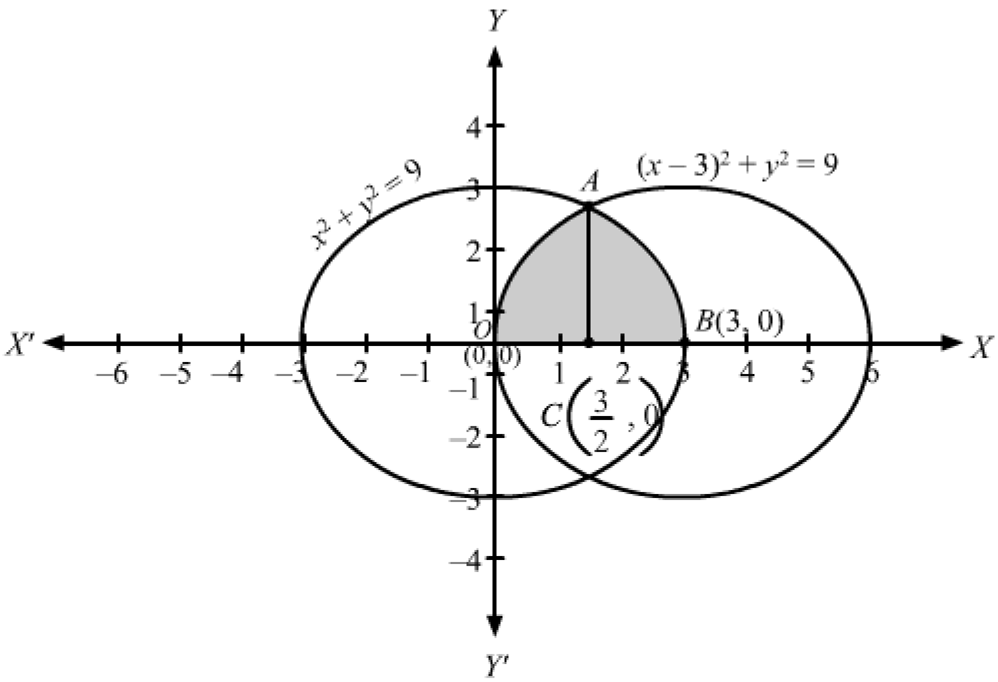
**Question 34**

Using integration find the area of the region bounded between the two circles $x^2 + y^2 = 9$ and $(x - 3)^2 + y^2 = 9$.

**OR**

Evaluate the following integral as the limit of sums $\int_1^4 \left(x^2-x\right)\,dx$.

**Solution:**



Let the two curves be named as $y_1$ and $y_2$ where

$$y_1:(x-3)^2+y^2=9 \qquad .....(1)$$

$$y_2:x^2+y^2=9 \qquad .....(2)$$

The curve $x^2+y^2=9$ represents a circle with centre (0, 0) and the radius is 3.

The curve $(x-3)^2+y^2=9$ represents a circle with centre (3, 0) and has a radius 3.

To find the intersection points of two curves equate them.

On solving (1) and (2) we get

$$x=\frac{3}{2} \text{ and } y=\pm\frac{3\sqrt{3}}{2}$$

Therefore, intersection points are $\left(\frac{3}{2},\ \frac{3\sqrt{3}}{2}\right)$ and $\left(\frac{3}{2},\ -\frac{3\sqrt{3}}{2}\right)$.

Now, the required area =2[area($OACO$) +area($CABC$)]

Here,

$$\text{Area}\,(OACO)=\int_0^{\frac{3}{2}} y_1\,\mathrm{d}\,x$$

$$=\int_0^{\frac{3}{2}}\sqrt{9-(x-3)^2}\,\mathrm{d}\,x$$

And

$$\text{Area}\,(CABC)=\int_{\frac{3}{2}}^{3} y_2.\,\mathrm{d}\,x$$

$$=\int_{\frac{3}{2}}^{3}\sqrt{9-x^2}dx$$

Thus the required area is given by,

$A$ = 2[area($OACO$) +area($CABC$)]

$= 2\left(\int_0^{\frac{3}{2}} \sqrt{9-(x-3)^2}\,\mathrm{d}x + \int_{\frac{3}{2}}^{3} \sqrt{9-x^2}\,\mathrm{d}x\right)$

$= 2\left[\frac{(x-3)}{2}\sqrt{9-(x-3)^2} + \frac{9}{2}\sin^{-1}\left(\frac{x-3}{3}\right)\right]_0^{\frac{3}{2}} + 2\left[\frac{x}{2}\sqrt{9-x^2} + \frac{9}{2}\sin^{-1}\left(\frac{x}{3}\right)\right]_{\frac{3}{2}}^{3}$

$= 2\left[\frac{\frac{3}{2}-3}{2}\sqrt{9-\left(\frac{3}{2}-3\right)^2} + \frac{9}{2}\sin^{-1}\left(\frac{\frac{3}{2}-3}{3}\right) - \frac{0-3}{2}\sqrt{9-(0-3)^2} - \frac{9}{2}\sin^{-1}\left(\frac{0-3}{3}\right)\right]$

$+ 2\left[\frac{3}{2}\sqrt{9-3^2} + \frac{9}{2}\sin^{-1}\left(\frac{3}{3}\right) - \left(\frac{3}{4}\sqrt{9-\frac{9}{4}}\right) - \frac{9}{2}\sin^{-1}\left(\frac{\frac{3}{2}}{3}\right)\right]$

$= 2\left[-\frac{9\sqrt{3}}{8} - \frac{9\pi}{12} + \frac{9\pi}{4}\right] + 2\left[\frac{9\pi}{4} - \frac{9\sqrt{3}}{8} - \frac{9\pi}{12}\right]$

$= -\frac{18\sqrt{3}}{8} - \frac{18\pi}{12} + \frac{18\pi}{4} + \frac{18\pi}{4} - \frac{18\sqrt{3}}{8} - \frac{18\pi}{12}$

$= \frac{-36\sqrt{3}}{8} - \frac{36\pi}{12} + \frac{36\pi}{4}$

$= -\frac{9\sqrt{3}}{2} - 3\pi + 9\pi$

$= 6\pi - \frac{9\sqrt{3}}{2}$

Hence the required area is $\left(6\pi - \frac{9\sqrt{3}}{2}\right)$ square units.

**OR**

Let $I = \int_1^4 \left(x^2 - x\right) dx$

$= \int_1^4 x^2\,dx - \int_1^4 x\,dx$

Let $I = I_1 - I_2$, where $I_1 = \int_1^4 x^2 dx$ and $I_2 = \int_1^4 x\,dx$ ...(1)

It is known that,

$\int_a^b f(x)\,\mathrm{d}x = (b-a)\lim_{n\to\infty} \frac{1}{n}\left[f(a) + f(a+h) + \ldots + f(a+(n-1)h)\right]$, where $h = \frac{b-a}{n}$

For $I_1 = \int_1^4 x^2 dx$,

$a = 1, b = 4$, and $f(x) = x^2$

$\therefore h = \frac{4-1}{n} = \frac{3}{n}$

$$I_1 = \int_1^4 x^2 dx = (4-1)\lim_{n\to\infty}\frac{1}{n}\left[f(1)+f(1+h)+\dots+f(1+(n-1)h)\right]$$

$$= 3\lim_{n\to\infty}\frac{1}{n}\left[1^2+\left(1+\frac{3}{n}\right)^2+\left(1+2\cdot\frac{3}{n}\right)^2+\dots\left(1+\frac{(n-1)3}{n}\right)^2\right]$$

$$= 3\lim_{n\to\infty}\frac{1}{n}\left[1^2+\left\{1^2+\left(\frac{3}{n}\right)^2+2\cdot\frac{3}{n}\right\}+\dots+\left\{1^2+\left(\frac{(n-1)3}{n}\right)^2+\frac{2\cdot(n-1)\cdot 3}{n}\right\}\right]$$

$$= 3\lim_{n\to\infty}\frac{1}{n}\left[\left(\underbrace{1^2+\dots+1^2}_{n\text{ times}}\right)+\left(\frac{3}{n}\right)^2\left\{1^2+2^2+\dots+(n-1)^2\right\}+2\cdot\frac{3}{n}\left\{1+2+\dots+(n-1)\right\}\right]$$

$$= 3\lim_{n\to\infty}\frac{1}{n}\left[n+\frac{9}{n^2}\left\{\frac{(n-1)(n)(2n-1)}{6}\right\}+\frac{6}{n}\left\{\frac{(n-1)(n)}{2}\right\}\right]$$

$$= 3\lim_{n\to\infty}\frac{1}{n}\left[n+\frac{9n}{6}\left(1-\frac{1}{n}\right)\left(2-\frac{1}{n}\right)+\frac{6n-6}{2}\right]$$

$$= 3\lim_{n\to\infty}\left[1+\frac{9}{6}\left(1-\frac{1}{n}\right)\left(2-\frac{1}{n}\right)+3-\frac{3}{n}\right]$$

$$= 3[1+3+3]$$

$$= 3[7]$$

$$I_1 = 21 \qquad \dots(2)$$

For $I_2 = \int_1^4 x dx$,

$a = 1, b = 4,$ and $f(x) = x$

$$\Rightarrow h = \frac{4-1}{n} = \frac{3}{n}$$

$$\therefore I_2 = (4-1)\lim_{n\to\infty}\frac{1}{n}\left[f(1)+f(1+h)+\dots f(a+(n-1)h)\right]$$

$$= 3\lim_{n\to\infty}\frac{1}{n}\left[1+(1+h)+\dots+(1+(n-1)h)\right]$$

$$= 3\lim_{n\to\infty}\frac{1}{n}\left[1+\left(1+\frac{3}{n}\right)+\dots+\left\{1+(n-1)\frac{3}{n}\right\}\right]$$

$$= 3\lim_{n\to\infty}\frac{1}{n}\left[\left(\underbrace{1+1+\dots+1}_{n\text{ times}}\right)+\frac{3}{n}\left(1+2+\dots+(n-1)\right)\right]$$

$$= 3 \lim_{n \to \infty} \frac{1}{n} \left[ n + \frac{3}{n} \left\{ \frac{(n-1)n}{2} \right\} \right]$$
$$= 3 \lim_{n \to \infty} \left[ 1 + \frac{3}{2} \left\{ 1 - \frac{1}{n} \right\} \right]$$
$$= 3 \left[ 1 + \frac{3}{2} \right]$$
$$= 3 \left[ \frac{5}{2} \right]$$
$$\Rightarrow I_2 = \frac{15}{2} \quad \ldots (3)$$

From equations (2) and (3), we obtain

$$I = I_1 + I_2 = 21 - \frac{15}{2} = \frac{27}{2}$$

**Question 35**

Find the minimum value of ($ax + by$), where $xy = c^2$.

**Solution:**

Given, $f(x) = ax + by$ and $xy = c^2$

$So\, y = \frac{c^2}{x} \ldots\ldots (1)$

Putting the value of $y$ in $f(x)$, we get

$$f(x) = ax + b\left(\frac{c^2}{x}\right)$$

To find the minimum value of $f(x)$ put $f'(x) = 0$

$$f'(x) = a - \frac{bc^2}{x^2} = 0$$
$$ax^2 - bc^2 = 0$$
$$x^2 = \frac{bc^2}{a}$$
$$x = c\sqrt{\frac{b}{a}}$$

Putting the value of x in $f(x)$

$$f(x) = ax + b\left(\frac{c^2}{x}\right)$$
$$f\left(c\sqrt{\frac{b}{a}}\right) = ac\sqrt{\frac{b}{a}} + b\left(\frac{c^2}{c\sqrt{\frac{b}{a}}}\right)$$
$$= c\sqrt{ab} + c\sqrt{ab}$$
$$= 2c\sqrt{ab}$$

Hence the minimum value of $(ax + by)$ is $2c\sqrt{ab}$.

## Question 36

If $a, b, c$ are $p^{th}$, $q^{th}$ and $r^{th}$ terms respectively of a G.P, then prove that $\begin{vmatrix} \log a & p & 1 \\ \log b & q & 1 \\ \log c & r & 1 \end{vmatrix} = 0$

OR

If $\mathbf{A} = \begin{bmatrix} 2 & -3 & 5 \\ 3 & 2 & -4 \\ 1 & 1 & -2 \end{bmatrix}$, then find $A^{-1}$.

Using $A^{-1}$, solve the following system of equations :

$2x - 3y + 5z = 11$

$3x + 2y - 4z = -5$

$x + y - 2z = -3$

## Solution:

Let x and y are the first term and common ratio respectively.

Then

$a = a_p = xy^{p-1}$, .....(1)

$b = a_q = xy^{q-1}$ .....(2) and

$c = a_r = xy^{r-1}$ .....(3)

Dividing (2) by (1), we get

$\frac{b}{a} = \frac{y^{q-1}}{y^{p-1}} = y^{q-p} \Rightarrow \log\left(\frac{b}{a}\right) = \left(q - p\right)\log y$ .....(4)

Dividing (3) by (2), we get

$\frac{c}{b} = \frac{y^{r-1}}{y^{q-1}} = y^{r-q} \Rightarrow \log\left(\frac{c}{b}\right) = \left(r - q\right)\log y$ .....(5)

Dividing (1) bt (3), we get

$\frac{a}{c} = \frac{y^{p-1}}{y^{r-1}} = y^{p-r} \Rightarrow \log\left(\frac{a}{c}\right) = \left(p - r\right)\log y$ .....(6)

Now,

$$\begin{vmatrix} \log a & p & 1 \\ \log b & q & 1 \\ \log c & r & 1 \end{vmatrix}$$

Expanding along $C_1$,

$= \log a(q-r) - \log b(p-r) + \log c(p-q)$

$= q\log a - r\log a - p\log b + r\log b + p\log c - q\log c$

$= q(\log a - \log c) + p(\log c - \log b) + r(\log b - \log a)$

$= q\log\left(\frac{a}{c}\right) + p\log\left(\frac{c}{b}\right) + r\log\left(\frac{b}{a}\right)$

$= q(p-r)\log y + p(r-q)\log y + r(q-p)\log y$ {from (4), (5) and (6)}

$= \log y(pq - qr + pr - pq + qr - pr)$

$= 0$

Hence proved.

**OR**

Now, $A_{11} = 0,\ A_{12} = 2,\ A_{13} = 1$

$A_{21} = -1,\ A_{22} = -9,\ A_{23} = -5$

$A_{31} = 2,\ A_{32} = 23,\ A_{33} = 13$

$$\therefore\ A^{-1} = \frac{1}{|A|}(adjA) = -\begin{bmatrix} 0 & -1 & 2 \\ 2 & -9 & 23 \\ 1 & -5 & 13 \end{bmatrix} = \begin{bmatrix} 0 & 1 & -2 \\ -2 & 9 & -23 \\ -1 & 5 & -13 \end{bmatrix} \quad ...(1)$$

Now, the given system of equations can be written in the form of *AX* = *B*, where

The solution of the system of equations is given by $X = A^{-1}B$.

$X = A^{-1}B$

$$\Rightarrow \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 & 1 & -2 \\ -2 & 9 & -23 \\ -1 & 5 & -13 \end{bmatrix}\begin{bmatrix} 11 \\ -5 \\ -3 \end{bmatrix} \quad [\text{Using } (1)]$$

$$= \begin{bmatrix} 0-5+6 \\ -22-45+69 \\ -11-25+39 \end{bmatrix}$$

$$= \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}$$

Hence, $x = 1,\ y = 2,$ and $z = 3$.
