# T Tips & Tricks

- ★ Formation of a chemical bond is always an exothermic process.
- Lattice energies of bi-bivalent solids > biunivalent solids > uni-univalent solids. For example, lattice energy of  $Mg^{2+}O^{2-}(3932 \ kJ \ mole^{-1}) > Ca^{2+}(F^{-})_2 \ (2581 \ kJ \ mole^{-1}) >$  $Li^+F^-(1034 \ kJ \ mole^{-1})$ .
- When co-ordination number increases, the coulombic forces of attraction increases and hence stability increases.
- ✓ Ionic solids have negative vapour pressure.
- As a general rule, atomic crystals are formed by the lighter elements of the middle columns of the periodic table.
- Boron forms the maximum number of electron deficient compounds than any other elements in the periodic table.
- $\varnothing$  Roughly each lone pair decreases the bond angle by 2.5°.
- ★ The actual number of s- and p-electrons present
  in the outermost shell of the element is called
  maximum covalency of that atom.
- ★ The hydrogen bonds are tetrahedral in their directions and not planar.
- The hydrogen bond is stronger in *HF* and persists even in vapour state. Such bonds account for the fact that gaseous hydrogen fluoride is largely

- polymerised into the molecular species  $H_2F_2, H_3F_3, H_4F_4, H_5F_5$  and  $H_6F_6$ .
- Hydrogen bonding is strongest when the bonded structure is stabilised by resonance.

# **Electrovalent bonding**

- 1. Which forms a crystal of *NaCl* 
  - [CPMT 1972; NCERT 1976; DPMT 1996]
  - (a) *NaCl* molecules
- (b)  $Na^+$  and  $Cl^-$  ions
- (c) Na and Cl atoms
- (d) None of the above
- 2. When sodium and chlorine reacts then [NCERT 1973]
  - (a) Energy is released and ionic bond is formed
- (b) Energy is released and a covalent bond is formed
  - (c) Energy is absorbed and ionic bond is formed
- (d) Energy is absorbed and covalent bond is formed  $% \left\{ \mathbf{r}^{\prime}\right\} =\left\{ \mathbf{r}^{\prime}$
- **3.** Which one is least ionic in the following compounds

[CPMT 1976; BHU 1998]

- (a) AgCl
- (b) KCl
- (c) *BaCl*<sub>2</sub>
- (d) CaCl<sub>2</sub>
- **4.** The electronic configuration of four elements L, P, Q and R are given in brackets  $L\left(1s^2,\ 2s^2\ 2p^4\right),\ Q\left(1s^2,\ 2s^2\ 2p^6,\ 3s^2\ 3p^5\right)$

$$P(1s^2, 2s^2 2p^6, 3s^1), R(1s^2, 2s^2 2p^6, 3s^2)$$

The formulae of ionic compounds that can be formed between these elements are [NCERT 1983]

- (a)  $L_2P$ , RL, PQ and  $R_2Q$  (b) LP, RL, PQ and RQ
- (c)  $P_2L$ , RL, PQ and  $RQ_2$  (d) LP,  $R_2L$ ,  $P_2Q$  and RQ
- 5. Electrovalent compound's

[MP PMT 1984]

- (a) Melting points are low
- (b) Boiling points are low
- (c) Conduct current in fused state
- (d) Insoluble in polar solvent
- **6.** A electrovalent compound is made up of

[CPMT 1978, 81; MNR 1979]

- (a) Electrically charged molecules
- (b) Neutral molecules
- (c) Neutral atoms
- (d) Electrically charged atoms or group of atoms
- 7. Electrovalent bond formation depends on

(b) Electron affinity (c) Sodium loses electron and chlorine accepts (a) Ionization energy (c) Lattice energy (d) All the three above electron In the following which substance will have 8. (d) Sodium accepts electron and chlorine loses highest boiling point [NCERT 1973; MP PMT 1990] electron (a) *He* (b) CsF Which of the following is an electrovalent linkage 17. (c)  $NH_2$ (d) CHCl<sub>2</sub> [CPMT 1974; DPMT 1984, 91; AFMC 1988] (a)  $CH_4$ (b)  $MgCl_2$ An atom of sodium loses one electron and chlorine 9. atom accepts one electron. This result the (c) SiCl<sub>4</sub> (d)  $BF_3$ formation of sodium chloride molecule. This type 18. Electrovalent compounds do not have [CPMT 1991] of molecule will be (a) High M.P. and Low B.P. (b) High dielectric constant [MP PMT 1987] (c) High M.P. and High B.P. (d) High polarity (a) Coordinate (b) Covalent Many ionic crystals dissolve in water because 19. (c) Electrovalent (d) Matallic bond [NCERT 1982] 10. Formula of a metallic oxide is MO. The formula (a) Water is an amphiprotic solvent of its phosphate will be [CPMT 1986, 93] (b) Water is a high boiling liquid (a)  $M_2(PO_4)_2$ (b)  $M(PO_A)$ (c) The process is accompanied by a positive heat (d)  $M_3(PO_4)_2$ (c)  $M_2PO_4$ of solution (d) Water decreases the interionic attraction in From the following which group of elements 11. the crystal easily forms cation lattice due to solvation (a) F, Cl, Br (b) Li, Na, K 20. The electronic structure of four elements A, B, C, (c) O, S, Se (d) N, P, As 12. Which type of compounds show high melting and (B)  $1s^2$ ,  $2s^2 2p^2$ (A)  $1s^2$ boiling points [CPMT 1996] (C)  $1s^2$ ,  $2s^2 2p^5$ (D)  $1s^2$ ,  $2s^2 2p^6$ (a) Electrovalent compounds (b) Covalent compounds The tendency to form electrovalent bond is largest (c) Coordinate compounds in (d) All the three types of compounds have equal [MNR 1987, 95] melting and boiling points (a) A (b) B Lattice energy of an ionic compound depends 13. (c) C (d) D upon Chloride of metal is  $MCl_2$ . The formula of its [AIEEE 2005] phosphate will be [CPMT 1979] (a) Charge on the ion only (b)  $M_3(PO_4)_2$ (a)  $M_2PO_4$ (b) Size of the ion only (c)  $M_2(PO_4)_3$ (d)  $MPO_{\Lambda}$ (c) Packing of ions only The phosphate of a metal has the formula  $MPO_4$ . (d) Charge on the ion and size of the ion The formula of its nitrate will be In the given bonds which one is most ionic 14. (b)  $M_2(NO_3)_2$ [EAMCET 1980] (a)  $MNO_3$ (a) Cs - Cl(b) Al - Cl(d)  $M(NO_3)_2$ (c)  $M(NO_3)_2$ (c) C-Cl(d) H-Cl**23.** In the transition of Zn atoms to  $Zn^{++}$  ions there is Element x is strongly electropositive and y is 15. a decrease in the [CPMT 1972] strongly electronegative. Both element are (a) Number of valency electrons univalent, the compounds formed from their (b) Atomic weight combination will be [IIT 1980] (c) Atomic number (a)  $x^+y^-$ (b)  $x^{-}y^{+}$ (d) Equivalent weight (c) x-y(d)  $x \rightarrow y$ In the formation of NaCl from Na and Cl [CPMT 1985]  $^{24}$ . Phosphate of a metal M has the formula  $M_3(PO_4)_2$ . The formula for its sulphate would be (a) Sodium and chlorine both give electrons [CPMT 1973; MP PMT 1996] (b) Sodium and chlorine both accept electrons

(a)  $MSO_4$ 

(b)  $M(SO_4)_2$ 

|      | (c) $M_2(SO_4)_3$                          | (d) $M_3(SO_4)_2$  |       | (d) Atoms of sodium a                       | nd chlorine   |
|------|--|--|-------|---|---|
| 5.   | The molecular form                         | ula of chloride of a metal $M$ is                        | 33.   | The phosphate of a me                       | etal has the formula $MHPO_4$ .   |
| _    |  | of its carbonate would be[CPMT 1                         | 1987] | The formula of its chlo                     | oride would be  |
|      | (a) MCO <sub>3</sub>                       | (b) $M_2(CO_3)_3$  |       |   | [NCERT 1974; CPMT 1977]   |
|      | _  | (d) $M(CO_3)_2$  |       | (a) MCl                                     | (b) <i>MCl</i> <sub>2</sub>   |

compared

**35.** As

(b) The electronegativity of hydrogen is equal to

(c) The electronegativity of chlorine is greater

that of chlorine

than that of hydrogen

(d) Hydrogen and chlorine are gases

to

(a) Low melting points and low boiling points

(b) Low melting points and high boiling points

electrovalent compounds generally have

covalent

[CPMT 1990, 94; MP PMT 1997]

compounds,

- (c) High melting points and low boiling points
- (d) High melting points and high boiling points
- The interatomic distances in  $H_2$  and  $Cl_2$ 36. molecules are 74 and 198 pm respectively. The bond length of HCl is

[MP PET 1993]

- (a) 272 pm
- (b) 136 pm
- (c) 124 pm
- (d) 248 pm
- On analysis, a certain compound was found to 37. contain iodine and oxygen in the ratio of 254 gm of iodine and  $80 \, gm$  of oxygen. The atomic mass of iodine is 127 and that of oxygen is 16. Which of the following is the formula of the compound
  - (a) *IO*
- (b)  $I_2O$
- (c)  $I_5O_2$
- (d)  $I_2O_5$
- **38.** Ionic and covalent bonds are present in [CBSE PMT 1990; MNR 1990; KCET 2000; UPSEAT 2001]
  - (a)  $CCl_4$
- (b) *CaCl*<sub>2</sub>
- (c)  $NH_{4}Cl$
- (d)  $H_2O$
- 39. Highest covalent character is found in [EAMCET 1992]
  - (a)  $CaF_2$
- (b) CaCl,
- (c)  $CaBr_2$
- (d) CaI,
- **40.** Among the following which property is commonly exhibited by a covalent compound [MP PET 1994]
  - (a) High solubility in water
  - (b) High electrical conductance
  - (c) Low boiling point
  - (d) High melting point
- 41. Atoms in the water molecule are linked by [MP PAT 1996] 48.
  - (a) Electrovalent bond
  - (b) Covalent bond
  - (c) Coordinate covalent bond
  - (d) Odd electron bond
- Which is the correct electron dot structure of  $N_2O$  molecule

[MP PET 1996]

(a) 
$$: N = N = O$$

(a) 
$$: N = N = O$$
 (b)  $: N = N^+ - O$ :

(c) 
$$N = N = O$$

$$:N=N=\stackrel{\cdot \cdot \cdot}{O}:$$

- **43.** A covalent bond between two atoms is formed by which of the following [MP PMT 1996]
  - (a) Electron nuclear attraction
  - (b) Electron sharing
  - (c) Electron transfer
  - (d) Electrostatic attraction

The electronic configuration of a metal M is 44.  $1s^2$ ,  $2s^2 2p^6$ ,  $3s^1$ . The formula of its oxides will be

[MP PET/PMT 1998]

- (a) *MO*
- (b)  $M_2O$
- (c)  $M_2O_3$
- (d)  $MO_2$
- Which of the following statements regarding 45. covalent bond is not true [MP PET/PMT 1998]
  - (a) The electrons are shared between atoms
  - (b) The bond is non-directional
  - (c) The strength of the bond depends upon the extent of overlapping
  - (d) The bond formed may or may not be polar
- If the electronic configuration of M = 2, 8, 3 and 46. that of A = 2, 8, 7, the formula of the compound is

[Bihar MEE 1996]

- (a)  $M_{2}A_{3}$
- (b)  $MA_2$
- (c)  $M_2A$
- (d)  $MA_3$
- (e)  $M_3A$
- The table shown below gives the bond 47. dissociation energies  $(E_{diss})$  for single covalent bonds of carbon (C) atoms with element A, B, C and D. Which element has the smallest atoms [CBSE PMT 1994]

| Bond | $E_{diss}$ (kJ mol <sup>-1</sup> ) |
|------|------------------------------------|
| C-A  | 240                                |

(a) A

(b) B

(c) C

- (d) D
- If a molecule  $X_2$  has a triple bond, then X will have the electronic configuration [CET Pune 1998]
  - (a)  $1s^2 2s^2 2p^5$
- (b)  $1s^2 2s^2 2p^3$
- (c)  $1s^2 2s^1$
- (d)  $1s^2 2s^2 2p^1$
- Which of the following compounds does not 49. follow the octet rule for electron distribution[CET Pune 19
  - (a)  $PCl_5$
- (b)  $PCl_3$
- (c)  $H_2O$
- (d)  $PH_3$
- The valency of A = 3 and B = 2, then the compound is

[Bihar MEE 1997]

- (a)  $A_2B_3$
- (b)  $A_3B_2$
- (c)  $A_3B_3$
- (d)  $A_2B_2$
- (e) None of these
- The number of electrons shared by each 51. outermost shell of  $N_2$  is [AFMC 1998]
  - (a) 2

(b) 3

(c) 4

(d) 5

|     |   |     | Chemical Bonding 105  |
|-----|---|-----|---|
| 52. | Which of the following substances when dissolved                          |     | (a) Two (b) Three   |
|     | in water will give a solution that does not conduct electricity           |     | (c) Four (d) Six  |
|     | [JIPMER 1999]   | 61. | The acid having $O-O$ bond is   |
|     | (a) Hydrogen chloride (b) Potassium hydroxide                             |     | [IIT JEE Screening 2004]  |
|     | (c) Sodium acetate (d) Urea   |     | (a) $H_2S_2O_3$ (b) $H_2S_2O_6$   |
| 53. | Which of the following atoms has minimum                                  |     | (c) $H_2S_2O_8$ (d) $H_2S_4O_6$   |
|     | covalent radius   | 62. | The following salt shows maximum covalent   |
|     | [DPMT 2000] (a) B (b) C   |     | character   |

| 58. | Which of the following is Lewis acid [RPET 2003]                          |     | nitrogen in an ammonia molecule are [MH CET 2004] (a) 8 (b) 5   |
|     | (a) $BF_3$ (b) $NH_3$   |     | (a) 6 (b) 5 (c) 6 (d) 7   |
|     | (c) $PH_3$ (d) $SO_2$   | 70. | Hydrogen atoms are held together to form  |
| 59. | Among the species : $CO_2$ , $CH_3COO^-$ , $CO$ , $CO_3^{2-}$ ,           |     | hydrogen molecules by [AMU 1982] (a) Hydrogen bond (b) Ionic bond                                     |

[Kerala PMT 2004]

HCHO which has the weakest carbon- oxygen

(a) *CO*<sub>2</sub> (b)  $CH_3COO^-$ 

(d)  $CO_3^{2-}$ 

(c) CO

bond

(e) HCHO

**60.** Valency of sulphur in  $Na_2S_2O_3$  is [DPMT 1984] 71. Strongest bond is (a) C-C(b) *C* – *H* 

(c) Covalent bond

(c) C-N(d) C-O

72. The major binding force of diamond, silicon and quartz is

[Kerala CET (Med.) 2002] (a) Electrostatic force (b) Electrical attraction

(d) Dative bond

[AFMC 1987]

106 Chemical Bonding (b) Electrons of one atom are shared with two (c) Co-valent bond force (d) Non-covalent bond atoms Multiple covalent bonds exist in a molecule of [NCERT 1973] 73. (c) Hydrogen bond is formed (d) None of the above (a)  $H_2$ (b)  $F_2$ Which of the following contains a coordinate (d)  $N_2$ (c)  $C_2H_4$ covalent bond Which of the following does not obey the octet 74. [MNR 1990; IIT 1986] (a)  $N_2O_5$ (b) *BaCl* , [EAMCET 1993] (c) HCl (d)  $H_2O$ (a) *CO* (b)  $NH_2$ A coordinate bond is formed when an atom in a (c)  $H_2O$ (d) PCl<sub>5</sub> molecule has Which of the following statements is correct for 75. (a) Electric charge on it covalent bond [BHU 1997] (b) All its valency electrons shared (a) Electrons are shared between two atoms (c) A single unshared electron (b) It may be polar or non-polar (d) One or more unshared electron pair (c) Direction is non-polar Which has a coordinate bond [RPMT 1997] 9. (d) Valency electrons are attracted (a)  $SO_3^{2-}$ (b)  $CH_{4}$ **76.** Among  $CaH_2$ ,  $NH_3$ , NaH and  $B_2H_6$ , which are covalent hydride [Orissa JEE 2005] (c) CO, (d)  $NH_3$ (a)  $NH_3$  and  $B_2H_6$ (b) NaH and CaH<sub>2</sub> 10. The compound containing co-ordinate bond is (c) NaH and  $NH_3$ (d)  $CaH_2$  and  $B_2H_6$ [AFMC 1999; Pb. CET 2002] (a)  $O_3$ (b) SO<sub>3</sub> Co-ordinate or Dative bonding (c)  $H_2SO_4$ (d) All of these Which species has the maximum number of lone The number of dative bonds in sulphuric acid pair of electrons on the central atom? molecules is (a)  $[ClO_3]^-$ (b)  $XeF_4$ [MP PET 2002] (a) o (b) 1  $SF_4$  (d)  $[I_3]^-$ (c) 2 (d) 4A simple example of a coordinate covalent bond is 12.[NWkich984the following compounds has coordinate exhibited by (dative) bond [RPET 2003] (a)  $C_2H_2$ (b)  $H_2SO_4$ (a)  $CH_3NC$ (b)  $CH_3OH$ (c)  $NH_3$ (d) HCl (c)  $CH_3Cl$ (d)  $NH_3$ The bond that exists between  $NH_3$  and  $BF_3$  is The structure of orthophosphoric acid is[KCET 2003] 13. called 0 [AFMC 1982; MP PMT 1985; MNR 1994; KCET 2000; MP PET 2001; UPSEAT 2001] (a) H - O - P - O - H(b)  $O \leftarrow P - O - H$ (a) Electrovalent (b) Covalent (d) Hydrogen (c) Coordinate Which of the following does not have a coordinate bond Н [MADT Bihar 1984] (c)  $O \leftarrow P - O - H$ (a) SO<sub>2</sub> (b)  $HNO_3$ (d) H-O-P=O(c)  $H_2SO_3$ (d)  $HNO_2$ Н

[Pb. PMT 1998]

- (a)  $BF_3$  is not spherically symmetrical but  $PF_3$  is
- (b)  $BF_3$  molecule must be linear
- (c) The atomic radius of P is larger than the atomic radius of B
- (d) The  $BF_3$  molecule must be planar triangular
- **22.** Which molecule does not show zero dipole moment

[RPET 1997, 99]

- (a)  $BF_3$
- (b)  $NH_3$
- (c) CCl<sub>4</sub>
- (d)  $CH_4$
- **23.** The dipole moment of HBr is  $1.6 \times 10^{-30}$  cm and interatomic spacing is 1Å. The % ionic character of HBr is

[MP PMT 2000]

(a) 7

(b) 10

(c) 15

- (d) 27
- 24. Non-polar solvent is

[RPET 2000]

- (a) Dimethyl sulphoxide (b) Carbon tetrachloride
- (c) Ammonia
- (d) Ethyl alcohol
- 25. Which shows the least dipole moment

[UPSEAT 2001; DPMT 1982]

- (a) *CCl*<sub>4</sub>
- (b) CHCl<sub>3</sub>
- (c)  $CH_3CH_2OH$
- (d)  $CH_3COCH_3$
- **26.** Which molecule has zero dipole moment[UPSEAT 2001]
  - (a)  $H_2O$
- (b) AqI
- (c) PbSO 4
- (d) HBr
- **27.** The dipole moment is zero for the molecule

[IIT 1989; MP PMT 2002]

- (a) Ammonia
- (b) Boron trifluoride
- (c) Sulphur dioxide
- (d) Water
- **28.**  $N_2$  is less reactive than  $CN^-$  due to [UPSEAT 2003]
  - (a) Presence of more electrons in orbitals
  - (b) Absence of dipole moment
  - (c) Difference in spin quantum no
  - (d) None of these
- 29. In a polar molecule, the ionic charge is  $4.8 \times 10^{-10}$  e.s.u. If the inter ionic distance is one Å unit, then the dipole moment is [MH CET 2003]
  - (a) 41.8 debye
- (b) 4.18 debye
- (c) 4.8 debye
- (d) 0.48 debye
- 30. Which of the following is a polar compound

[Pb. CET 2000]

- (a) HCl
- (b)  $H_2Se$

- (c)  $CH_{\Lambda}$
- (d) HI
- 31. Which of the following has no dipole moment

[DCE 2002]

- (a) *CO*<sub>2</sub>
- (b)  $SO_3$
- (c)  $O_3$
- (d)  $H_2O$
- **32.** Which of the following is non-polar [DCE 2002]
  - (a) *PCl*<sub>5</sub>
- (b)  $PCl_3$
- (c)  $SF_6$
- (d) *IF*<sub>7</sub>
- **33.** Identify the non-polar molecule in the set of compounds given :  $HCl, HF, H_2, HBr$  [UPSEAT 2004]
  - (a)  $H_2$
- (b) HCl
- (c) HF, HBr
- (d) HBr
- **34.** Dipole moment is shown by

[IIT 1986]

- (a) 1, 4-dichlorobenzene
  - (b) cis 1, 2-dichloroethene
  - (c) trans 1, 2-dichloroethene
  - (d) trans 1, 2-dichloro-2-pentene
- 35. If *HCl* molecule is completely polarized, so expected value of dipole moment is 6.12D (deby), but experimental value of dipole moment is 1.03D. Calculate the percentage ionic character [Kerala CET 2005]
  - (a) 17
- (b) 83
- (c) 50
- (d) Zero
- (e) 90

# Polarisation and Fajan's rule

.  $BF_3$  and  $NF_3$  both molecules are covalent, but  $BF_3$  is non-polar and  $NF_3$  is polar. Its reason is

[CPMT 1989; NCERT 1980]

- - (b) B-F bond has no dipole moment whereas N-F bond has dipole moment
- (c) The size of boron atom is smaller than nitrogen  $% \left\{ 1\right\} =\left\{ 1\right\}$ 
  - (d)  $BF_3$  is planar whereas  $NF_3$  is pyramidal
- Which one is polar molecule among the following
  - (a) *CO*<sub>2</sub>
- (b) *CCl*<sub>4</sub>
- (c)  $H_2O$
- (d)  $CH_4$
- 3. If the electron pair forming a bond between two atoms *A* and *B* is not in the centre, then the bond is [AIIMS 1984]
  - (a) Single bond
- (b) Polar bond
- (c) Non-polar bond
- (d)  $\pi$  bond

| 4.    | Which of the following a non-uniform electrost   | liquids is not deflected by atic field                 | 13. | (c) $CH_2Cl_2$  | (d) $CH_2 = CH_2$<br>g have both polar and non- |  |

|       | (-) GGI  | [Orissa JEE 1997]                                      |     | ( ) CIT   | [MP PMT 2002]                                   |  |
|       | (a) <i>CCl</i> <sub>4</sub>                      | (b) <i>CO</i> <sub>2</sub>                             |     | (a) ClF   | (b) <i>PCl</i> <sub>3</sub>                     |  |

- (c)  $SiF_{\Lambda}$
- (d)  $CFCl_3$
- **23.** Which of the following compounds has least dipole moment

[RPET 2003]

- (a)  $PH_3$
- (b) CHCl<sub>3</sub>
- (c)  $NH_3$
- (d)  $BF_3$
- **24.** Pauling's electronegativity values for elements are useful in predicting [UPSEAT 2004]
  - (a) Polarity of bonds in molecules
  - (b) Position of elements in electrochemical series
  - (c) Co-ordination number
  - (d) Dipole moment of various molecules
- **25.** Amongst LiCl, RbCl,  $BeCl_2$  and  $MgCl_2$  the compounds with the greatest and the least ionic character, respectively, are [UPSEAT 2002]
  - (a) LiCl and RbCl
- (b) RbCl and BeCl 2
- (c) RbCl and MgCl<sub>2</sub>
- (d)  $MgCl_2$  and  $BeCl_2$
- **26.** Bond polarity of diatomic molecule is because of [UPSEAT 2002]
  - (a) Difference in electron affinities of the two atoms
  - (b) Difference in electronegativities of the two atoms
  - (c) Difference in ionisation potential
  - (d) All of these

#### Overlaping- $\sigma$ and $\pi$ - bonds

- Triple bond in ethyne is formed from
   [MP PMT 1990; NCERT 1979; EAMCET 1978; AMU 1985;
   CPMT 1988; MADT Bihar 1982; MH CET 2000]
  - (a) Three sigma bonds
  - (b) Three pi bonds
  - (c) One sigma and two pi bonds
  - (d) Two sigma and one pi bond
- 2. The bond in the formation of fluorine molecule will be

[MP PMT 1987]

- (a) Due to s-s overlapping
- (b) Due to s-p overlapping
- (c) Due to p-p overlapping
- (d) Due to hybridization
- 3. Which type of overlapping results the formation of a  $\pi$  bond

[DPMT 1981]

- (a) Axial overlapping of s-s orbitals
- (b) Lateral overlapping of p-p orbitals
- (c) Axial overlapping of p-p orbitals
- (d) Axial overlapping of s-p orbitals

- **4.** The number and type of bonds between two carbon atoms in calcium carbide are **[AIEEE 2005]** 
  - (a) One sigma, one pi
- (b) One sigma, two pi
- (c) Two sigma, one pi
- (d) Two singma, two pi
- **5.** In a double bond connecting two atoms, there is a sharing of

[CPMT 1977, 80, 81; NCERT 1975; Bihar MEE 1980; MP PET 1999]

- (a) 2 electrons
- (b) 1 electron
- (c) 4 electrons
- (d) All electrons
- **6.** Strongest bond is
- [DPMT 1990]
- (a) C-C
- (b) C = C
- (c)  $C \equiv C$
- (d) All are equally strong
- 7.  $\pi$  bond is formed
- [JIPMER 2002]
- (a) By overlapping of atomic orbitals on the axis of nuclei  $% \left\{ 1,2,...,n\right\}$ 
  - (b) By mutual sharing of pi electron
- (c) By sidewise overlapping of half filled p-orbitals
  - (d) By overlapping of s-orbitals with p-orbitals
- 8. The double bond between the two carbon atoms in ethylene consists of [NCERT 1981; EAMCET 1979]
  - (a) Two sigma bonds at right angles to each other
  - (b) One sigma bond and one pi bond
  - (c) Two pi bonds at right angles to each other
  - (d) Two pi bonds at an angle of  $60^{\circ}$  to each other
- **9.** In the series ethane, ethylene and acetylene, the C-H bond energy is **[NCERT 1977]** 
  - (a) The same in all the three compounds
  - (b) Greatest in ethane
  - (c) Greatest in ethylene
  - (d) Greatest in acetylene
- 10. In a sigma bond
  - (a) Sidewise as well as end to end overlap of orbitals take place
  - (b) Sidewise overlap of orbitals takes place
  - (c) End to end overlap of orbitals takes place
  - (d) None of the above
- **11.** The number of sigma and pi bonds in 1-butene-3-yne are

[IIT 1989]

- (a) 5 sigma and 5 pi
- (b) 7 sigma and 3 pi
- (c) 8 sigma and 2 pi
- (d) 6 sigma and 4 pi
- 12. The most acidic compound among the following is [MP PET 1993]
  - (a)  $CH_3CH_2OH$
- (b)  $C_6H_5OH$
- (c) CH<sub>3</sub>COOH
- (d)  $CH_3CH_2CH_2OH$
- 13. Which of the following is not correct[CBSE PMT 1990]
  - (a) A sigma bond is weaker than  $\,\pi$  bond
  - (b) A sigma bond is stronger than  $\pi$  bond

- (c) A double bond is stronger than a single bond
- (d) A double bond is shorter than a single bond
- Strongest bond formed, when atomic orbitals 14.
  - (a) Maximum overlap
- (b) Minimum overlap
  - (c) Overlapping not done
- (d) None of them
- The p-p orbital overlapping is present in the 15. [MP PET 1994] following molecule
  - (a) Hydrogen
- (b) Hydrogen bromide
- (c) Hydrogen chloride
- (d) Chlorine
- In  $N_2$  molecule, the atoms are bonded by

#### [MP PET 1996; UPSEAT 2001]

- (a) One  $\sigma$ , Two  $\pi$
- (b) One  $\sigma$ , One  $\pi$
- (c) Two  $\sigma$ , One  $\pi$
- (d) Three  $\sigma$  bonds
- In which of following there exists a  $p\pi d\pi$ 17. bonding

[AFMC 2001]

- (a) Diamond
- (b) Graphite
- (c) Dimethyl amine
- (d) Trisilylamine
- **18.** Number of bonds in  $SO_2$

[DCE 2001]

- (a) Two  $\sigma$  and two  $\pi$
- (b) Two  $\sigma$  and one  $\pi$
- (c) Two  $\sigma$ , two  $\pi$  and one lone pair
- (d) None of these
- Which of the following has  $p\pi d\pi$  bonding [CBSE 2002] 19.
  - (a)  $NO_{3}^{-}$
- (b)  $CO_3^{-2}$
- (c)  $BO_3^{-3}$
- (d)  $SO_{3}^{-2}$
- Number of sigma bonds in  $P_4O_{10}$  is [AIEEE 2002]
  - (a) 6

(b) 7

- (c) 17
- (d) 16

# **Hybridisation**

- Which molecule is not linear [CPMT 1994] 1.
  - (a)  $BeF_2$
- (b) BeH<sub>2</sub>
- (c) *CO*<sub>2</sub>
- (d)  $H_2O$
- The bond angle in water molecule is nearly or 2. Directed bonds in water forms an angle of

[NCERT 1980; EAMCET 1981; MNR 1983, 85; AIIMS 1982; CPMT 1989; MP PET 1994, 96;

**MP PET/PMT 1998]** 

- (a) 120°
- **(b)** 180°
- (c) 109°28'
- (d) 104°30'
- The central atom in a molecule is in  $sp^2$  hybrid 3. state. The shape of molecule will be [MP PMT 1987; CBSE PMT 1989]
  - (a) Pyramidal
- (b) Tetrahedral
- (c) Octahedral
- (d) Trigonal planar
- Which molecule is linear

[MP PMT 1984: IIT 1982, 88: EAMCET 1993: CBSE PMT 1992; MP PET 1995; RPMT 1997]

- (a)  $NO_2$
- (b) ClO<sub>2</sub>
- (c) *CO*<sub>2</sub>
- (d)  $H_2S$
- Which of the following molecules has trigonal planer geometry [CBSE PMT 2005]
  - (a)  $IF_3$
- (b)  $PCl_3$
- (c)  $NH_3$
- (d)  $BF_3$
- A  $sp^3$  hybridized orbital contains

#### [DPMT 1984; BHU 1985; CPMT 1976]

- (a)  $\frac{1}{4}s$  character
- (b)  $\frac{1}{2}s$  character
- (c)  $\frac{2}{3}s$  character (d)  $\frac{3}{4}s$  character
- Structure of ammonia is

[MP PMT 1987, 89, 91; CPMT 1975, 82; RPMT 1999; JIPMER 2002]

- (a) Trigonal
- (b) Tetrahedral
- (c) Pyramidal
- (d) Trigonal pyramidal
- The bond angle in ethylene is 8.
- [CPMT 1987]

- (a) 180°
- **(b)** 120°
- (c) 109°
- (d) 90°

Compound formed by  $sp^3d$  hybridization will have structure

[BHU 1982; RPMT 1999]

- (a) Planar
- (b) Pyramidal
- (c) Angular
- (d) Trigonal bipyramidal
- Which of the following formula does not correctly 10. represent the bonding capacity of the atom involved

[CBSE PMT 1990]

- (a)  $\begin{bmatrix} H P H \\ H \end{bmatrix}$

- Which of the following statement is not correct

- (a) Hybridization is the mixing of atomic orbitals prior to their combining into molecular orbitals
- (b)  $sp^2$  hybrid orbitals are formed from two p atomic orbitals and one s atomic orbital
- (c)  $d^2sp^3$  hybrid orbitals are directed towards the corners of a regular octahedron

sigma bonding orbital used by  ${\it M}$  are

#### [IIT 1981; MP PMT 1994; Kerala PMT 2004]

- (a)  $sp^3d$  hybrid
- (b) sp hybrid
- (c)  $sp^3d^2$  hybrid
- (d)  $sp^2$  hybrid
- 149. The linear structure is assumed by
- [IIT 1991]

- (a) SnCl,
- (b) NCO -
- (c) CS<sub>2</sub>
- (d)  $NO_2^+$
- **150.** Hybridisation of central atom in  $NF_3$  is [Orissa JEE 2005]
  - (a)  $sp^3$
- (b) sp
- (c)  $sp^2$
- (d)  $dsp^2$
- 151. The pair having similar geometry is [J&K CET 2005]
  - (a)  $PCl_3$ ,  $NH_3$
- (b)  $BeCl_2, H_2O$
- (c)  $CH_4$ ,  $CCl_4$
- (d)  $IF_5$ ,  $PF_5$
- **152.** The *d*-orbital involved in  $sp^3d$  hybridisation is
  - [J&K CET 2005]

- (a)  $d_{x^2-y^2}$
- (b)  $d_{yy}$
- (c)  $d_{2}$
- (d)  $d_{zx}$

#### Resonance

- 1. Which one in the following is not the resonance structure of  ${\it CO}_2$ 
  - (a) O = C = O
- (b)  ${}^{-}O C \equiv O^{+}$
- (c)  $^{+}O \equiv C O^{-}$
- (d)  $O \equiv C = O$
- **2.** Which of the following molecule contains one pair of non-bonding electrons
  - (a)  $CH_4$
- (b)  $NH_3$
- (c)  $H_2O$
- (d) HF
- 3. Resonance is due to[NCERT 1981; Kurukshetra CEE 1998]
  - (a) Delocalization of sigma electrons
  - (b) Delocalization of pi electrons
  - (c) Migration of H atoms
  - (d) Migration of protons
- 4. Resonating structures have different [AMU 1983]
  - (a) Atomic arrangements
- (b)Electronic arrangements
- (c) Functional groups
- (d) Alkyl groups
- 5. In the cyanide ion, the formal negative charge is on

[AMU 1984]

- (a) C
- (b) N
- (c) Both C and N
- (d) Resonate between C and N
- **6.** Which does not show resonance [CPMT 1990]
  - (a) Benzene
- (b) Aniline
- (c) Ethyl amine
- (d) Toluene

**7.** The enolic form of acetone contains

#### [IIT 1990; Bihar MEE 1997]

- (a) 9 sigma bonds, 1 pi bond and 2 lone pairs
- (b) 8 sigma bonds, 2 pi bonds and 2 lone pairs
- (c) 10 sigma bonds, 1 pi bond and 1 lone pair
- (d) 9 sigma bonds, 2 pi bonds and 1 lone pair

Point out incorrect statement about resonance

[MP PET 1997]

- (a) Resonance structures should have equal energy
  - (b) In resonance structures, the constituent atoms should be in the same position
  - (c) In resonance structures, there should not be the same number of electron pairs
  - (d) Resonance structures should differ only in the location of electrons around the constituent atoms
- 9. The number of possible resonance structures for  $CO_3^{2-}$  is

[MP PMT 2000]

(a) 2

(b) 3

(c) 6

- (d) 9
- **10.** Resonance hybrid of nitrate ion is **[RPET 2000]**

(a) 
$$^{-1/2}O$$
  $\longrightarrow N$   $\longrightarrow N$  (b)  $^{-2/3}O$   $\longrightarrow N$   $\longrightarrow O^{-2/3}$   $\bigcirc O^{-2/3}$   $\bigcirc O^{-2/3}$ 

(c) 
$${}^{-1/3}O = N = 0^{-1/3}$$
 (d)  ${}^{-2/3}O = N = 0^{-2/3}$   ${}^{+}O = 0^{-2/3}$   ${}^{-2/3}O = 0^{-2/3}$   ${}^{-2/3}O = 0^{-2/3}$ 

11.  $CO_3^{2-}$  anion has which of the following characteristics

[Roorkee 1999]

- (a) Bonds of unequal length
- (b)  $sp^2$  hybridization of C atom
- (c) Resonance stabilization
- (d) Same bond angles

## **VSEPR Theory**

1. The structure of  $\left[Cu\left(H_2O\right)_4\right]^{++}$  ion is

[NCERT 1983; MP PMT 1983]

- (a) Square planar
- (b) Tetrahedral
- (c) Distorted rectangle (d) Octahedral
- 2. The bond angle in  $PH_3$  would be expected to be close to
  - (a) 90°
- (b) 105°
- (c) 109°
- (d) 120°

  - (a)  $CO_3^{2-}$
- (b)  $NH_2$
- (c)  $PCl_3$
- (d) None of these
- The shape of  $CH_3^+$  species is

[RPET 1999]

- (a) Tetrahedral
- (b) Square planar
- (c) Trigonal planar
- (d) Linear
- 27. Which of the following is the correct reducing order of bond-angle [BHU 2000]
  - (a)  $NH_3 < CH_4 < C_2H_2 < H_2O$
  - (b)  $C_2H_2 > NH_3 > H_2O < CH_4$
  - (c)  $NH_3 > H_2O > CH_4 < C_2H_2$
  - (d)  $H_2O < NH_3 > CH_4 < C_2H_2$
- **28.** Which compound has bond angle nearly to  $90^{\circ}$ 
  - (a)  $H_2O$
- (b)  $H_2S$
- (c)  $NH_3$
- (d)  $CH_4$
- 29. A lone pair of electrons in an atom implies [KCET 2002]
  - (a) A pair of valence electrons not involved in bonding
  - (b) A pair of electrons involved in bonding
  - (c) A pair of electrons
  - (d) A pair of valence electrons
- **30.** The bond angle of water is  $104.5^{\circ}$  due to [CPMT 2002]
  - (a) Repulsion between lone pair and bond pair
  - (b)  $sp^3$  hybridization of O
  - (c) Bonding of  $H_2O$
  - (d) Higher electronegativity of O
- The correct sequence of decrease in the bond 31. angle of the following hybrides is [MP PET 2002]
  - (a)  $NH_3 > PH_3 > AsH_3 > SbH_3$
  - (b)  $NH_3 > AsH_3 > PH_3 > SbH_3$
  - (c)  $SbH_3 > AsH_3 > PH_3 > NH_3$
  - (d)  $PH_3 > NH_3 > AsH_3 > SbH_3$
- **32.** Central atom of the following compound has one lone pair of electrons and three bond pairs of electrons[JIPMER42002]Which of the following gives correct arrangement
  - (a)  $H_2S$
- (b) AlCl<sub>3</sub>
- (c)  $NH_3$
- (d)  $BF_3$
- **33.** Among  $KO_2$ ,  $AlO_2^-$ ,  $BaO_2$  and  $NO_2^+$ unpaired electron is present in [MP PET 2003]

- (a)  $NO_2^+$  and  $BaO_2$
- (b)  $KO_2$  and  $AlO_2^-$

[RPET 2003]

- (c)  $KO_2$  only
- (d)  $BaO_2$  only
- **34.** True order of bond angle is
  - (a)  $H_2O > H_2S > H_2Se > H_2Te$
  - (b)  $H_2Te > H_2Se > H_2S > H_2O$
  - (c)  $H_2S > H_2O > H_2Se > H_2Te$
  - (d)  $H_2O > H_2S > H_2Te > H_2Se$
  - Which of the following has not a lone pair over the central atom [Orissa JEE 2003]
    - (a)  $NH_3$
- (b) PH<sub>2</sub>
- (c)  $BF_3$
- (d)  $PCl_3$
- In BrF<sub>2</sub> molecule, the lone pairs occupy equatorial positions to minimize [CBSE PMT 2004]
  - (a) Lone pair- lone pair repuilsion and lone pairbond pair repulsion
  - (b) Lone pair-lone pair repulsion only
  - (c) Lone pair- bond pair repulsion only
  - (d) Bond pair-bond pair repulsion only
- $H_2O$  is dipolar, whereas  $BeF_2$  is not. It is because 37.

[CBSE PMT 1989; 2004]

- (a)  $H_2O$  is linear and  $BeF_2$  is angular
- (b)  $H_2O$  is angular and  $BeF_2$  is linear
- (c) The electornegativity of F is greater than that
- (d)  $H_2O$  involves hydrogen bonding BeF2 is a discrete molecule
- 38. Maximum bond angle is present in [BVP 2004]
  - (a)  $BCl_3$
- (b)  $BBr_3$
- (c)  $BF_3$
- (d) Same for all
- The shape of a molecule of  $NH_3$ , in which central atoms contains lone pair of electron, is [MHCET 2003]
  - (a) Tetrahedral
- (b) Planar trigonal
- (c) Square planar
- (d) Pyramidal
- 40. The largest bond angle is in [DCE 2002; MNR 1984]
  - (a)  $AsH_3$
- (b)  $NH_3$
- (c)  $H_2O$
- (d)  $PH_3$
- The bond angle in ammonia molecule is[EAMCET 1980]
  - (a) 91°8′
- (b) 93°3'
- (c) 106°45'
- (d) 109°28'

of compounds involved based on their bond strength

[BHU 2005]

- (a) HF > HCl > HBr > HI
- (b) HI > HBr > HCl > HF
- (c) HF > HBr > HCl > HI

- (d) HCl > HF > HBr > HI
- 43. Which one has a pyramidal structure [CBSE PMT 1990]
  - (a)  $CH_A$
- (b)  $NH_3$
- (c)  $H_2O$
- (d)  $CO_2$
- 44. Among the following the pair in which the two species are not isostructural is [CBSE PMT 2004]
  - (a)  $BH_4^-$  and  $NH_4^+$
- (b)  $PF_6^-$  and  $SF_6$
- (c)  $SiF_A$  and  $SF_A$
- (d)  $IO_3^-$  and  $XeO_3$
- The maximum number of 90° angles between 45. bond pair-bond pair of electrons is observed in [AIEEE 2004] Oxygen molecule is paramagnetic because
  - (a)  $dsp^2$  hybridization
- (b)  $sp^3d$  hybridization
- (c)  $dsp^3$  hybridization (d)  $sp^3d^2$  hybridization

# Molecular orbital theory

- Bond order is a concept in the molecular orbital 1. theory. It depends on the number of electrons in the bonding and antibonding orbitals. Which of the following statements is true about it? The bond order [AIIMS 1980]
  - (a) Can have a negative quantity
  - (b) Has always an integral value
  - (c) Can assume any positive or integral or fractional value including zero
  - (d) Is a non zero quantity
- The bond order of NO molecule is [MP PET 1996] 2.
  - (a) 1

- (b) 2
- (c) 2.5
- (d) 3
- When two atomic orbitals combine they form 3.
  - (a) One molecular orbital
- (b)Two molecular orbital
- (c) Three molecular orbital (d)Four molecular orbital13.
- Which of the following species is the least stable 4.
  - (a)  $O_2$
- (b)  $O_2^{-2}$
- (c)  $O_2^{+1}$
- (d)  $O_2^{-1}$
- 5. The bond order is maximum in

#### [AIIMS 1983, 85; CBSE PMT 1994; MP PET 2002]

- (a)  $O_2$
- (b)  $O_2^{-1}$
- (c)  $O_2^{+1}$
- (d)  $O_2^{-2}$
- 6. Which of the following compounds of boron does not exist in the free form
  - (a)  $BCl_3$
- (b)  $BF_2$
- (c)  $BBr_3$
- (d)  $BH_3$
- Molecular orbital theory was developed mainly by 7. [BHU 1987; Pb. CET 2003]
  - (a) Pauling
- (b) Pauling and Slater
- (c) Mulliken
- (d) Thomson
- The bond order of a molecule is given by [NCERT 1984] 8.

- (a) The difference between the number of electrons in bonding and antibonding orbitals
- (b) Total number of electrons in bonding and antibonding orbitals
- (c) Twice the difference between the number of bonding and electrons in antibonding electrons
- (d) Half the difference between the number of in bonding and antibonding electrons electrons

[NCERT 1984; IIT 1984]

- (a) Bonding electrons are more than antibonding electrons
  - (b) Contains unpaired electrons
- (c) Bonding electrons are less than antibonding electrons
- (d) Bonding electrons are equal to antibonding electrons
- 10. Which one is paramagnetic from the following [IIT 1989; CBSE PMT 1995]
  - (a)  $O_{2}^{-}$
- (b) NO
- (c) Both (a) and (b)
- (d) CN
- The bond order in  $N_2^+$  ion is [Pb. CET 2004]
  - (a) 1

- (b) 2
- (c) 2.5
- (d) 3
- Out of the following which has smallest bond length

[RPMT 1997]

- (a)  $O_2$
- (b)  $O_2^+$
- (c)  $O_2^-$
- (d)  $O_2^{2-}$

Which of the following molecule is paramagnetic [CPMT 1980; RPET 1999;MP PMT 1999; RPMT 2000]

- (a) Chlorine
- (b) Nitrogen
- (c) Oxygen
- (d) Hydrogen
- Which molecule has the highest bond order
  - (a)  $N_2$
- (b) *Li*<sub>2</sub>
- (c) He 2
- (d)  $O_2$
- The molecular electronic configuration of  $H_2^-$  ion 15.
  - (a)  $(\sigma 1s)^2$
- (b)  $(\sigma 1s)^2 (\sigma^x 1s)^2$
- (c)  $(\sigma 1s)^2 (\sigma^x 1s)^1$
- (d)  $(\sigma 1s)^3$
- The paramagnetic nature of oxygen molecule is best explained on the basis of
  - (a) Valence bond theory (b) Resonance
  - (c) Molecular orbital theory (d) Hybridization
- In which case the bond length is minimum 17. between carbon and nitrogen
  - (a)  $CH_3NH_2$
- (b)  $C_6H_5CH = NOH$

(b) The electrovalent linkages between atoms

(c) LiCl > CsCl > NaCl > KCl > RbCl

- (d) NaCl > LiCl > KCl > RbCl > CsCl
- **16.** In the following which molecule or ion possesses electrovalent, covalent and co-ordinate bond at the same time
  - (a) HCl
- (b)  $NH_4^+$
- (c) Cl<sup>-</sup>
- (d)  $H_2O_2$
- **17.** Both ionic and covalent bond is present in the following

[MNR 1986; MP PMT 2004]

- (a)  $CH_4$
- (b) KCl
- (c)  $SO_2$
- (d) NaOH
- **18.** The formation of a chemical bond is accompanied by

[MP PET 1995]

- (a) Decrease in energy
- (b) Increase in energy
- (c) Neither increase nor decrease in energy
- (d) None of these
- 19. Chemical bond implies

[KCET 2002]

- (a) Attraction
- (b) Repulsion
- (c) Neither attraction nor repulsion
- (d) Both (a) and (b)
- 20. Which of the following statements is true[AIEEE 2002]
  - (a) HF is less polar than HBr
  - (b) Absolutely pure water does not contain any ions
  - (c) Chemical bond formation take place when forces of attraction overcome the forces of repulsion
  - (d) In covalency transference of electron takes place
- 21. Which of the following statements is true about  $[Cu(NH_3)_4]SO_4$  [CPMT 1988]
  - (a) It has coordinate and covalent bonds
  - (b) It has only coordinate bonds
  - (c) It has only electrovalent bonds
  - (d) It has electrovalent, covalent and coordinate bonds
- 22. Blue vitriol has
  - (a) Ionic bond
- (b) Coordinate bond
- (c) Hydrogen bond
- (d) All the above
- **23.** The number of ionic, covalent and coordinate bonds in  $NH_4Cl$  are respectively [MP PMT 1999]
  - (a) 1, 3 and 1
- (b) 1, 3 and 2

- (c) 1, 2 and 3
- (d) 1, 1 and 3
- **24.** Covalent molecules are usually held in a crystal structure by

[CPMT 1987]

[MP PET 1995]

- (a) Dipole-dipole attraction
- (b) Electrostatic attraction
- (c) Hydrogen bonds
- (d) Vander Waal's attraction

- 1. The values of electronegativity of atoms A and B are 1.20 and 4.0 respectively. The percentage of ionic character of A B bond is
  - (a) 50 %
- (b) 43 %
- (c) 55.3 %
- (d) 72.24%
- 2.  $O_2^{2-}$  is the symbol of ..... ion

[EAMCET 2003]

- (a) Oxide
- (b) Superoxide
- (c) Peroxide
- (d) Monoxide
- **3.** The number of electrons that are paired in oxygen molecule is
  - (a) 7

(b) 8

(c) 14

- (d) 16
- 4. When  $N_2$  goes to  $N_2^+$ , the N-N bond distance ..... and when  $O_2$  goes to  $O_2^+$ , the O-O bond distance ......

[IIT 1996]

- (a) Decrease, increase
- (b) Increase, decrease
- (c) Increase, increase
- (d) None of these
- Which of the following contains a coordinate covalent bond

[UPSEAT 2001]

- (a)  $N_2H_5^+$
- (b) *BaCl* 2
- (c) HCl
- (d)  $H_2O$
- **6.** Which combination is best explained by the coordinate covalent bond[JIPMER 2001; CBSE PMT 1990]
  - (a)  $H^+ + H_2O$
- (b) Cl + Cl
- (c)  $Mg + \frac{1}{2}O_2$
- (d)  $H_2 + I_2$
- Arrange the following compounds in order of increasing dipole moment.

- (I) Toluene
- (II) m dichlorobenzene

(III)

- o-dichlorobenzene (IV)
- [IIT 1996]
- (a) I < IV < II < III
- (b) IV < I < II < III
- (c) IV < I < III < II
- (d) IV < II < I < III
- 8. The correct order of dipole moment is [Roorkee 1999]
  - (a)  $CH_4 < NF_3 < NH_3 < H_2O$
  - (b)  $NF_3 < CH_4 < NH_3 < H_2O$
  - (c)  $NH_3 < NF_3 < CH_4 < H_2O$
  - (d)  $H_2O < NH_3 < NF_3 < CH_4$
- Which of the following has the highest dipole 9. moment

#### [AIIMS 2002]

(a) 
$$H \subset C = O$$

$$(b) \begin{array}{ccc} H & CH \\ CH & CH \\ CH & CH \end{array}$$

$$CH_3 H$$

$$C = C$$

$$CH_3 H$$

$$\begin{array}{ccc}
Cl & Cl \\
 & C \\
CH_3 & Cl
\end{array}$$

- Which of the following arrangement of molecules 10. is correct on the basis of their dipole moments [AIIMS 2002]
  - (a)  $BF_3 > NF_3 > NH_3$
- (b)  $NF_3 > BF_3 > NH_3$
- (c)  $NH_3 > BF_3 > NF_3$
- (d)  $NH_3 > NF_3 > BF_3$
- The type of hybrid orbitals used by the chlorine 11. atom in  $ClO_2^-$  is [IIT 1992]
  - (a)  $sp^3$
- (b)  $sp^2$
- (c) sp
- (d) None of these
- Among the following species, identify the 12. isostructural pairs,  $NF_3$ ,  $NO_3^-$ ,  $BF_3$ ,  $H_3O^+$ ,  $HN_3$  [IIT 1996]
  - (a)  $[NF_3, NO_3^-]$  and  $[BF_3, H_3O^+]$
  - (b)  $[NF_3, HN_3]$  and  $[NO_3^-, BF_3]$
  - (c)  $[NF_3, H_3O^+]$  and  $[NO_3^-, BF_3]$
  - (d)  $[NF_3, H_3O^+]$  and  $[HN_3, BF_3]$
- In the compound  $CH_2 = CH CH_2 CH_2 C \equiv CH$ , the  $C_2 - C_3$  bond is of the type [IIT 1999]
  - (a)  $sp sp^2$
- (b)  $sp^3 sp^3$
- (c)  $sp sp^3$
- (d)  $sp^2 sp^3$
- The correct order of increasing C-O bond length 14. of CO,  $CO_3^{2-}$ ,  $CO_2$  is [IIT 1999]
  - (a)  $CO_3^{2-} < CO_2 < CO$
- (b)  $CO_2 < CO_3^{2-} < CO$
- (c)  $CO < CO_3^{2-} < CO_2$
- (d)  $CO < CO_2 < CO_3^{2-}$
- In the dichromate dianion [IIT 1999] 15.

- (a) 4Cr O bonds are equivalent
- p thichlorobenzene are equivalent
  - (c) All Cr O bonds are equivalent
  - (d) All Cr O bonds are non-equivalent
- Bond length of ethane (I), ethene (II), acetylene 16. (III) and benzene (IV) follows the order[CPMT 1999]
  - (a) I > II > III > IV
- (b) I > II > IV > III
- (c) I > IV > II > III
- (d) III > IV > II > I
- Hybridisation state of chlorine in  $ClF_3$  is [RPET 1999] 17.
  - (a)  $sp^3$
- (b)  $sp^{3}d$
- (c)  $sp^3d^2$
- (d)  $sp^3d^3$
- Molecular shapes of  $SF_4$ ,  $CF_4$  and  $XeF_4$  are

#### [IIT Screening 2000]

- (a) The same with 2, 0 and 1 lone pairs of electrons respectively
- (b) The same, with 1, 1 and 1 lone pairs of electrons respectively
- (c) Different, with 0, 1 and 2 lone pairs of electrons respectively
- (d) Different, with 1, 0 and 2 lone pairs of electrons respectively

Structure of  $IF_4^+$  and hybridization of iodine in this structure are [UPSEAT 2001]

- (a)  $sp^3d$ , Linear
- (b)  $sp^3d^2$ , T-shaped
- (c)  $sp^3d$ , Irregular tetrahedral
- (d)  $sp^3d^2$ , Octahedral
- In which of the following the central atom does not use  $sp^3$  hybrid orbitals in its bonding[UPSEAT 2001, 02
  - (a)  $BeF_3^-$
- (b)  $OH_{3}^{+}$
- (c)  $NH_{2}^{-}$
- (d)  $NF_3$
- 21. The magnetic moment of  $K_3[Fe(CN)_6]$  is found to be 1.7 B.M. How many unpaired electron (s) is/are present per molecule [Orissa JEE 2003]
  - (a) 1
- (b) 2
- (c) 3

- (d) 4
- **22.**  $N_2$  and  $O_2$  are converted into monocations  $N_2^+$ and  $O_2^+$  respectively. Which is wrong[CBSE PMT 1997]
  - (a) In  $N_2$ , the N-N bond weakens
  - (b) In  $O_2$ , the O-O bond order increases
  - (c) In  $O_2$ , paramagnetism decreases
  - (d)  $N_2^+$  becomes diamagnetic
- The common features among the species  $CN^-$ , CO23. and  $NO^+$  are [IIT Screening 2001]
  - (a) Bond order three and isoelectronic
  - (b) Bond order three and weak field ligands

- (c) Bond order two and  $\pi$ -acceptors
- (d) Isoelectronic and weak field ligands
- The number of S-S bonds in sulphur trioxide 24. trimer  $S_3O_9$  is [IIT Screening 2001]
  - (a) Three
- (b) Two
- (c) One
- (d) Zero
- Strongest intermolecular hydrogen bond is 25. present in the following molecules pairs
  - (a)  $SiH_A$  and SiF
  - (b)  $CH_3 C CH_3$  and  $CHCl_3$
  - (c) H-C-OH and  $CH_3-C-OH$
  - (d)  $H_2O$  and  $H_2O_2$
- **26.** A compound contains atoms X, Y, Z. The oxidation number of X is +2, Y is +5 and Z is -2. Therefore, a possible formula of the compound is [CPMT 1988]
  - (a) XYZ,
- (b)  $X_2(YZ_3)_2$
- (c)  $X_3 (YZ_4)_2$
- (d)  $X_3 (Y_4 Z)_2$
- **27.** Bonds present in  $CuSO_4.5H_2O$  is
  - (a) Electrovalent and covalent
  - (b) Electrovalent and coordinate
  - (c) Electrovalent, covalent and coordinate
  - (d) Covalent and coordinate
- 28. The ionization of hydrogen atom would give rise

#### [UPSEAT 2001]

- (a) Hybrid ion
- (b) Hydronium ion
- (c) Proton
- (d) Hydroxyl ion
- Which can be described as a molecule with 29. residual bonding capacity
  - (a) *BeCl* ,
- (b) NaCl
- (c)  $CH_{\Lambda}$
- (d)  $N_2$

Read the assertion and reason carefully to mark the correct option out of the options given below:

- If both assertion and reason are true and the reason is the correct explanation of the assertion.
- (b) If both assertion and reason are true but reason is not the correct explanation of the assertion.
- (c) If assertion is true but reason is false.

- (d) If the assertion and reason both are false.
- (e) If assertion is false but reason is true.
- 1. Assertion: Water is a good solvent for ionic compounds but poor one covalent compounds.
  - Reason Hydration energy of ions releases [IIT 1981; suction of the cient lattice energy and break hydrogen bonds in water, while covalent bonded compounds interact weakly that even Vander Wall's forces between molecules covalent compounds cannot be broken.
- The atoms in a covalent molecule Assertion: are said to share electrons, yet some covalent molecules are polar.
  - Reason In a polar covalent molecule, the shared electrons spend more time on the average near one of the atoms. [AIIMS 1996]
- Diborane is electron deficient 3. Assertion: [IIReg8gnDCE 20difere are no enough valence electrons to form the expected number of covalent bonds[AIIMS 2001]
- A resonance hybrid is always more Assertion: stable than any of its canonical structures
  - Reason This stability is due delocalization of electrons[AIIMS 1999]
- Assertion: All F-S-F angle in  $SF_4$  greater 5. than 90° but less than 180°
  - The lone pair-bond pair repulsion is Reason weaker than bond pair-bond pair repulsion

#### [JIPMER 2000] [AIIMS 2004]

6. Assertion: The electronic structure of  $O_3$  is

structure is not allowed Reason

> because octet around cannot be expanded.

> > [IIT 1998]

[AIIMS 1996]

- Assertion: Bond order can assume any value number including zero
  - Higher the bond order, shorter is Reason bond length and greater is bond

energy

[AIIMS 1999]

| 8. | Assertion: | Ortho nit                        | nolecules are |             |  |  |
|----|------------|----------------------------------|---------------|-------------|--|--|
|    |            | associated                       | due to the    | presence of |  |  |
|    |            | intermolecu                      | ılar hydro    | gen bonding |  |  |
|    |            | while pa                         | aranitrophen  | ol involves |  |  |
|    |            | intramolecular, hydrogen bonding |               |             |  |  |

Reason : Ortho nitrophenol is more volatile than the para nitrophenol[AIIMS 1999]

 ${\bf 9.} \quad \hbox{Assertion} \ : \quad \hbox{Nitrogen molecule diamagnetic}.$ 

Reason :  $N_2$  molecule have unpaired electrons.

10. Assertion: Ice is less dense than liquid water.

Reason : There are vacant spaces between hydrogen bonded water molecules

in ice.

**11.** Assertion: Water is liquid but  $H_2S$  is a gas.

Reason : Oxygen is paramagnetic.

 $\textbf{12.} \quad \text{Assertion} \; : \quad \text{Iodine is more soluble in water then}$ 

in carbon tetrachloride.

Reason : Iodine is a polar compound.

**13.** Assertion : o and p-nitrophenols can be

separated by steam distillation.

Reason : o-nitrophenol have intramolecular

 $\begin{array}{lll} \mbox{hydrogen} & \mbox{bonding} & \mbox{while} & p - \\ \mbox{nitrophenol} & \mbox{exists} & \mbox{as associated} \end{array}$ 

molecules.

**14.** Assertion: The fluorine has lower reactivity.

Reason : F-F bond has low bond

dissociation energy.

**15.** Assertion :  $\sigma$  is strong while  $\pi$  is a weak bond.

Reason : Atoms rotate freely about  $\pi$  bond.

**16.** Assertion: The crystal structure gets stabilized even though the sum of electron

gain enthalpy and ionization

enthalpy is positive.

Reason : Energy is absorbed during the

formation of crystal lattice.

17. Assertion: Order of lattice energy for same

halides are as LiX > NaX > KX.

Reason : Size of alkaline - earth metal

increases from Li to K.

18. Assertion: Born-Haber cycle is based on Hess's

law.

Reason : Lattice enthalpy can be calculated

by Born- Haber cycle.

19. Assertion: Bond energy has order like

 $C - C < C = C < C \equiv C.$ 

Reason : Bond energy increases with

increase in bond order.

20. Assertion: Electron affinity refers to an

isolated atom's attraction for an

additional electron while

electronegativity is the ability of an element to attract electrons towards itself in a shared pair of electrons.

Reason : Electron affinity is a relative

number and electronegativity is

experimentally measurable.

**21.** Assertion: Geometry of  $SF_4$  molecule can be

termed as distorted tetrahedron, a

folded square or see saw.

Reason : Four fluorine atoms surround or

form bond with sulphur molecule.

**22.** Assertion:  $BF_3$  has greater dipole moment

than  $H_2S$ .

Reason : Fluorine is more electronegative

than sulphur.

23. Assertion: The bond between two identical

nonmetal atoms has a pair of

electrons with identical spin.

Reason : Electrons are transferred fully from

one atom to another.

**24.** Assertion :  $B_2$  molecule is diamagnetic.

Reason : The highest occupied molecular

orbital is of  $\sigma$  type. [AIIMS 2005]

**25.** Assertion: The nearly tetrahedral arrangement

of the orbitals about the oxygen atom allows each water molecule to form hydrogen bonds with as many as four neighbouring water

molecules.

Reason: In ice each molecule forms four

hydrogen bonds as each molecule is

fixed in the space.

**26.** Assertion: The bond order of helium is always

zero.

Reason : The number of electrons in bonding

molecular orbital and antibonding

molecular orbital is equal.

# Answers and Solutions

#### **Electrovalent bonding**

- 1. (b) NaCl is ionic crystal so it is formed by  $Na^+$  and  $Cl^-$  ions.
- **2.** (a) Bond formation is always exothermic. Compounds of sodium are ionic.
- **3.** (a) According to Fajan's rule ionic character is less.
- **4.** (c) Valencies of L, Q, P and R is -2, -1, +1 and +2 respectively so they will form  $P_2L$ , RL, PQ and  $RO_2$ .
- **5.** (c) Electrovalent compounds are good conductor of heat and electricity in molten state or in aqueous solution.
- 7. (d) Electrovalent bond formation depends on ionization energy of cation, electron affinity of anion and on lattice energy.
- **8.** (b) Because CsF is electrovalent compound.
- **9.** (c) *NaCl* is formed by electrovalent bonding.
- 10. (d) Valency of metal is + 2 by formula MO so its phosphate would be  $M_3(PO_4)_2$  because valency of  $[PO_4]$  is 3.
- **11.** (b) *Li*, *Na* and *K* are alkali metals with low ionization energy and one electron in their outermost shell so they will form cation easily.
- **12.** (a) Melting point and boiling point of electrovalent compounds are high due to strong electrostatic force of attraction between the ions.
- 13. (d) The value of lattice energy depends on the charges present on the two ions and distance between them. It shell be high if charges are high and ionic radii are small.
- **14.** (a) *Cs* is more electropositive.
- **15.** (a) *X* loses electron, *Y* gains it.
- **16.** (c) Formation of NaCl occurs by  $Na_{ion}^+$  and  $Cl_{ion}^-$ .
- 17. (b)  $MgCl_2$  has electrovalent linkage because magnesium is electropositive metal while chlorine is electronegative.

- **18.** (a) Electrovalent compounds generally have high m.pt and high b.pt due to stronger coulombic forces of attractions.
- **19.** (d) Water is a polar solvent so it decreases the interionic attraction in the crystal lattice due to solvation.
- **20.** (c) Element *C* has electronic structure  $1s^2$ ,  $2s^22p^5$ , it requires only one electron to complete its octet and it will form anion so it will form electrovalent bond.
- **21.** (b) Since the chloride of a metal is  $MCl_2$  therefore metal 'M' must be divalent *i.e.*  $M^{2+}$ . As a result the formula of its phosphate is  $M_3(PO_4)_2$ .
- **22.** (d) In  $MPO_4$  the oxidation state of M is +3. Hence, the formula of nitrate is  $M(NO_3)_3$ .
- **23.** (a) Ion is formed by gaining or losing electrons. To form cation electron are lost from the valency shell, so Zn atoms to  $Zn^{++}$  ions there is a decrease in the no. of valency electron.
- **24.** (a)  $M_3(PO_4)_2$  means M is divalent so formula of its sulphate is  $MSO_4$ .
- **25.** (b) As the molecular formula of chloride of a metal M is  $MCl_3$ , it is trivalent so formula of its carbonate will be  $M_2(CO_3)_3$ .
- **26.** (d) Sodium chloride is electrovalent compound so it dissolves in water which is a polar solvent.
- **27.** (d) When sodium chloride is dissolved in water, the sodium ion is hydrated.
- **30.** (d) Yet the formula of sulphate of a metal (M) is  $M_2(SO_4)_3$ , it is  $M^{3+}$  ion so formula of its phosphate would be  $MPO_4$ .
- **32.** (b) Molten sodium chloride conducts electricity due to the presence of free ions.
- 33. (b) The phosphate of a metal has the formula  $MHPO_4$  it means metal is divalent so its chloride would be  $MCl_2$ .
- **34.** (d)
- **35.** (b) Cs is highly electropositive while F is highly electronegative so they will form ionic bond.
- **37.** (b) *Na* is highly electropositive while *Cl* is highly electronegative so they will form ionic bond.
- **38.** (a) Ionic compounds are good conductors of heat and electricity so they are good electrolyte.
- **39.** (a) Metal tends to lose electrons due to low ionization energy.
- **40.** (c) As the formula of calcium pyrophosphate is  $Ca_2P_2O_7$  means valency of pyrophosphate

- radical is 4 so formula of ferric pyrophosphate is  $Fe_4(P_2O_7)_3$ .
- **41.** (c) M-X bond is a strongest bond so between Na-Cl is a strongest bond.
- **42.** (b) The solubility order is :  $BeF_2 > MgF_2 > CaF_2 > SrF_2 \quad \text{so} \quad SrF_2 \quad \text{is least soluble}$
- **43.** (d) *NaF* has maximum melting point, melting point decreases of sodium halide with increase in size of halide their bond energy get lower.
- **44.** (b) Sulphanilic acids have bipolar structure so their melting point is high and insoluble in organic solvents.
- **45.** (c)  $CaCl_2$  will have electrovalent bonding because calcium is electropositive metal while chlorine is electronegative so they will combined with electrovalent bond.
- **47.** (a) Electrovalent bond is formed by losing electrons from one atom and gaining electron by other atom *i.e.* redox reaction.
- **48.** (b) Electrovalent compound are polar in nature because they are formed by ions.
- **50.** (b) *CsCl* has ionic bonding.
- **51.** (b) As soon as the electronegativity increases, ionic bond strength increases.
- **52.** (b) This X element is a second group element so its chloride will be  $XCl_2$ .
- **53.** (a) When electronegativity difference is from 1.7 to 3.0. This bond is called as ionic bond.
- **54.** (a) Ethyl chloride is an organic compound so it will be covalent.
- **55.** (a) Lithium oxide and calcium fluoride show ionic characters.
- 57. (a) Generally cation and anion form ionic bond.
- **58.** (c) Those atoms which contain +*ve* and -*ve* sign are known as ion.
- **59.** (a) Generally *Br-F* contain maximum electronegativity difference compare to other compound.
- **61.** (a) Due to greater electronegativity difference.
- **64.** (d)  $BaCl_2$  contain higher ionic character.
- **66.** (a) Electrolytes are compound which get dissociated into their ion in water so it contains electrovalent bond.

- **67.** (abc)  $CaH_2$ ,  $BaH_2$ ,  $SrH_2$  are ionic hydride.
- **68.** (bcd) Generally  $MgCl_2$ ,  $SrCl_2$ ,  $BaCl_2$  are ionic compounds so they conduct electricity in fused state.

#### **Covalent bonding**

- **2.** (c) In  $N_2$  molecule each Nitrogen atom contribute  $3e^-$  so total no. of electron's are 6.
- 3. (b) Non-metals readily form diatomic molecules by sharing of electrons. Element  $M(1s^2\ 2s^2\ 2p^5)$  has seven electrons in its valence shell and thus needs one more electron to complete its octet. Therefore, two atoms share one electron each to form a diatomic molecule  $(M_2)$

 $: \stackrel{\cdot \cdot \cdot}{M} \cdot + \stackrel{\cdot \cdot \cdot}{M} : \rightarrow \underbrace{(:M:M:)}_{\cdot \cdot \cdot}$ 

- **5.** (d) Covalent character depend on the size of cation and anion.
- **6.** (a) In graphite all carbon atoms are  $sp^2$ -hybridised and have covalent bond.
- 7. (c) Silica has tendency to form long chain covalent structure such as carbon so it has giant covalent structure.
- 8. (a) All have linear structure. O = C = O, Cl Hq Cl, HC = CH
- **9.** (d) Similar atoms form covalent bond.
- **10.** (a) Covalent bond forms when electronegativity difference of two atom is equal to 1.7 or less than 1.7
- 11. (b) Similar atoms form covalent bond.
- **12.** (b) Water is a polar solvent while covalent compounds are non-polar so they usually insoluble in water.
- 13. (c)  $BCl_3$  is electron deficient compound because it has only '6' electrons after forming bond.
- **14.** (b) Due to its small size and 2 electrons in *s*-orbital *Be* forms covalent compound.
- **18.** (c)  $H_2O$  will formed by covalent bonding.
- **21.** (a) Two identical atoms are joined with covalent bond so  $H_2$  will be covalent.
- 23. (c) Element 'X' has atomic no. 7 so its electronic configuration will be 2, 5. So its electron dot symbol would be : X.
- **24.** (c) *C-S* will be most covalent. Covalent character depend on the size of cation and anion.

- **25.** (c) *HCl* has ionic character yet it has covalent compound because electronegativity of chlorine is greater than that of hydrogen.
- **26.** (c) Order of polarising power  $Be^{++} > Li^+ > Na^+$ Hence order of covalent character  $BeCl_2 > LiCl > NaCl$ .
- 31. (b) Valency of phosphorus in  $H_3PO_4$  is supposed 'x' then 3+x-8=0, x-5=0, x=5.
- **33.** (d)  $(+1) + x + 3(-2) = 0 \Rightarrow 1 + x 6 = 0 \Rightarrow x = 6 1 = 5$ .
- **34.** (a) *HCl* molecule has covalent bond.
- **35.** (d) Electrovalent compounds have high melting point and high boiling point.
- 36. (b) Middle length of  $H_2 = 74 \, pm$ Length of  $H = \frac{74}{2} = 37 \, pm$ Middle length of  $Cl_2 = 198 \, pm$ Length of  $Cl = \frac{198}{2} = 99 \, pm$ Bond length of HCl = Length of H + Length

Bond length of HCl = Length of H + Length of Cl

$$= 37 + 99 = 136 pm$$

- 37. (d) Compound has 254 gm of  $I_2$  means  $\frac{254}{127} = 2$  mole, while 80 gm  $O_2$  means  $\frac{80}{16} = 5$  mole so they will form compound  $I_2O_5$ .
- **38.** (c)  $NH_4Cl$  has covalent as well as ionic bond.

$$\begin{bmatrix} H \\ H - N \rightarrow H^+ \\ I \end{bmatrix} Cl^-$$

- **39.** (d) Covalent character increases when we come down a group so  $CaI_2$  will have highest covalent character.
- **41.** (b) In water molecule three atom are linked by covalent bond. Structure is  $\frac{O}{H}$
- **42.** (b) :  $N = N^+ \overset{\cdots}{O}$ : or  $N = N \to O$ .
- **44.** (b) The electronic configuration of Na(Z=11) is  $1s^2, 2s^2 2p^6, 3s^1$ . The oxide of Na is  $Na_2O$ .
- **45.** (b) Covalent bond is directional.
- **47.** (d) Bond dissociation energy decreases with increase in size. So *D* is smallest.
- **48.** (b) Molecule X is nitrogen because nitrogen molecule has triple bond. It's configuration will be  $1s^2$ ,  $2s^22p^3$ .

- **49.** (a)  $PCl_5$  does not follow octet rule, it has 10 electrons in its valence shell.
- **50.** (a) The compound will be  $A_2B_3$  (By criss cross rule).
- **51.** (b) Each nitrogen share 3 electrons to form triple bond.
- **52.** (d) Urea solution does not conduct electricity because it is a covalent compound.
- **54.** (d) Due to the small size and higher ionization energy, boron forms covalent compound.
- **58.** (a)  $BF_3$  contain 6 electron so it is lewis acid.
- **59.** (d) Among the given species. The bond dissociation energy of C-O bond is minimum in case of  $CO_3^{2-}$  by which C-O bond become more weaker in  $CO_3^{2-}$  or the bond order of  $CO_3^{2-}$  (1.33) is minimum so the bond become weaker.
- **60.** (a) Valency of  $Na_2S_2O_3$  is supposed to be x, then 2 + 2x + (-6) = 0, 2x 4 = 0, x = 2.
- 61. (c) H O S O O S O H (Marshall acid)
- **62.** (a) Among the given choice Al is least electropositive therefore, the bond between Al and Cl will be least ionic or most covalent or the difference in electronegativeity of two atom is less than 1.8.
- **63.** (b) Electronic configuration of  $_{16}S^{32} = 1s^2, 2s^2, 2p^6, 3s^2, 3p^4$ . In the last orbit it has only 6 electron. So it require 2 electron to complete its octet, therefore it share 2 electron with two hydrogen atom and forms 2 covalent bond with it.
- **64.** (b) The acidity of hydrides of VI group elements increase from top to bottom as the bond strength X-H decrease from top to bottom  $H_2O < H_2S < H_2Se < H_2Te$
- **65.** (b) We know that  $Al^{+3}$  cation is smaller than  $Na^+$  (because of greater nuclear change) According to Fajan's rule, small cation polarise anion upto greater extent. Hence  $Al^{3+}$  polarise  $Cl^-$  ion upto greater extent, therefore  $AlCl_3$  has covalent bond between Al and Cl atoms.
- **66.** (b) Sulphur has the second highest catenation property after carbon. Its molecule has eight atom bonded together (*i.e.*  $S_8$ )
- **67.** (b)  $H_2O_2$  has open book structure.

**69.** (b) The electronic configuration of nitrogen is  ${}_{7}N = 1s^2.2s^2.2p^3$ 

It has 5 electrons in valency shell, hence in ammonia molecule it complete its octet by sharing of three electron with three H atom, therefore it has 8 electrons in its valence shell in ammonia molecule

$$\begin{array}{ccc} & \cdots & \cdots \\ H \times \cdot N \cdot \times H & \text{ or } H - N - H \\ & & & H \\ & & & H \end{array}$$

- **71.** (c) Multiple bonds have more bond energy so  $C \equiv N$  will be the strongest.
- **72.** (c) Diamond, silicon and quartz molecule bounded by covalent bond.
- **73.** (cd)  $C_2H_4$  and  $N_2$  has multiple bonds.
- **74.** (ad) CO has only 6 electrons while  $PCl_5$  has 10 electrons after sharing so both don't follow octet rule.
- **76.** (a) Among these, NaH and  $CaH_2$  are ionic hydrides and  $B_2H_6$  and  $NH_3$  are covalent hydrides.

#### Co-ordinate or Dative bonding

**1.** (d)

**2.** (b)  $H_2SO_4$  has co-ordinate covalent bond.

$$\begin{array}{c}
O \\
\uparrow \\
O - S \\
O
\end{array}$$

- **3.** (c)  $NH_3$  has lone pair of electron while  $BF_3$  is electron deficient compound so they form a co-ordinate bond.  $NF_3 \rightarrow BF_3$
- **4.** (d)  $HNO_2$  does not have co-ordinate bond. Structure is H-O-N=O.

- 7. (a) Structure of  $N_2O_5$  is O = N O N = O.
- 9. (a)  $SO_3^{2-}$  has one coordinate bond.  $O S O^{-}$
- 10. (d) Co-ordinate bond is a special type of covalent bond which is formed by sharing of electrons between two atoms, where both the electrons of the shared pair are contributed by one atom. Since this type of sharing of electrons exits in  $O_3$ ,  $SO_3$  and  $H_2SO_4$ . Therefore all these contains coordinate bond.
- **12.** (a)  $CH_3N = C$  contain dative bond.
- 13. (a)  $H_3PO_4$  is orthophosphoric acid.

$$\begin{matrix} O & \uparrow \\ H-O-\overset{\uparrow}{P}-O-H \\ O \\ \downarrow \\ H \end{matrix}$$

**15.** (c) Sulphuric acid contain, covalent and coordinate bond.

## **Dipole moment**

- 1. (b)  $CO_2$  is a symmetrical molecule so its dipole moment is zero.
- 2. (d) These all have zero dipole moment.
- **3.** (d) *HF* has largest dipole moment because electronegativity difference of both is high so it is highly polar.
- **5.** (c) Due to its symmetrical structure.
- **6.** (c) Chloroform has 3 chlorine atom and one hydrogen atom attached to the carbon so it is polarised and it will show dipole moment.
- **8.** (a) The dipole moment of two dipoles inclined at an angle  $\theta$  is given by the equation  $\mu = \sqrt{X^2 + Y^2 + 2XY \cos \theta}$

 $\cos 90^\circ = 0$ . Since the angle increases from 90-180, the value of  $\cos \theta$  becomes more and more – ve and hence resultant decreases. Thus, dipole moment is maximum when  $\theta = 90^\circ$ .

**9. (c)** Due to distorted tetrahedral geometry  $SF_4$  has permanent dipole moment F

- 10. (b)  $CCl_4$  has no net dipole moment because of its regular tetrahedral structure.
- **12.** (d) *H-F* is polar due to difference of electronegativity of hydrogen and fluorine so it shows positive dipole moment.

- **14.** (c)  $BCl_3$  has zero dipole moment because of its trigonal planar geometry.
- **16.** (c) Dipole moment of  $CH_3OH$  is maximum in it.
- **20.** (b)  $CH_4$  have regular tetrahedron so its dipole moment is zero.
- 22. (b) Ammonia have some dipole moment.
- **23.** (b) Charge of  $e^- = 1.6 \times 10^{-19}$ Dipole moment of  $HBr = 1.6 \times 10^{-30}$ Inter atomic spacing  $= 1 \text{ Å} = 1 \times 10^{-10} \, m$ % of ionic character in

$$HBr = \frac{\text{dipole moment of } HBr \times 100}{\text{inter spacing distance } \times q}$$

$$= \frac{1.6 \times 10^{-30}}{1.6 \times 10^{-19} \times 10^{-10}} \times 100$$

$$=10^{-30} \times 10^{29} \times 100 = 10^{-1} \times 100 = 0.1 \times 100 = 10\%$$

- **25.** (a) Carbon tetrachloride has a zero dipole moment because of its regular tetrahedral structure.
- **27.** (b)  $BF_3$  has zero dipole moment.
- **29.** (c) Given ionic charge =  $4.8 \times 10^{-10}$  e.s.u. and ionic distance =  $1A^{\circ} = 10^{-8}$  cm we know that dipole moment = ionic charge × ionic distance =  $4.8 \times 10^{-10} \times 10^{-8}$  =  $4.8 \times 10^{-8}$  e.s.u. per cm = 4.8 debye.
- **30.** (a) Higher is the difference in electronegativity of two covalently bonded atoms, higher is the polarity. In *HCl* there is high difference in the electronegativity of *H* and *Cl* atom so it is a polar compound.
- 31. (a) Linear molecular has zero dipole moment  $CO_2$  has linear structure so it does not have the dipole moment O=C=O.
- **32.** (c)  $SF_6$  is symmetrical and hence non polar because its net dipole moment is zero.
- **33.** (a) Polarity create due to the difference in electronegativity of both atom in a molecule except  $H_2$  all other molecule have the different atom so they will have the polarity while  $H_2$  will be non polar.
- **34.** (bd) *cis* isomer shows dipole moment while that of trans is zero or very low value. Trans 1, 2 di-chloro-2-pentene will also show dipole moment due to unsymmetry.
- **35.** (a) % of ionic character
  - $= \frac{\text{Experiment al value of dipole moment}}{\text{Expected value of dipole moment}}$

$$= \frac{1.03}{6.12} \times 100 = 16.83\% \approx 17\%$$

#### Polarisation and Fajan's rule

- 1. (d)  $BF_3$  is planar while  $NF_3$  is pyramidal due to the presence of lone pair of electron on nitrogen in  $NF_3$ .
- **2.** (c)  $H_2O$  is a polar molecule due to electronegativity difference of hydrogen and oxygen.
- 3. (b) When electronegativity difference is more between two joined atoms then covalent bond becomes polar and electron pair forming a bond don't remain in the centre.
- **4.** (d) Hexane has symmetrical structure so does not have polarity.
- **5.** (c) When two identical atoms form a bond, bond is non-polar.
- **6.** (a) According to Fajan's rule, polarisation of anion is influenced by charge and size of cation more is the charge on cation, more is polarisation of anion.
- 8. (a) When two atoms shares two electrons it is an example of covalent bond. This covalent bond may be polar or may be non-polar depends on the electronegativity difference. In given example formula is AB. So it is polar.
- **9.** (c) *HCl* is most polar due to high electronegativity of *Cl*.
- **10.** (b)  $NH_3$  has  $sp^3$  hybridised central atom so it is non planar.
- (d) p-dichloro benzene have highest melting point.
- 13. (b)  $N\!H_4Cl$  has both types of bonds polar and non polar

$$\begin{bmatrix} H \\ H - N \to H \\ H \end{bmatrix}^{+} Cl^{-}$$

- **14.** (b) Greater the charge of cation more will be its polarising power (according to Fajan's rule).
- **15.** (d)  $AlI_3$  Aluminiumtriiodide shows covalent character. According to Fajan's rule.
- **16.** (d) As the size of anion increases, polarity character increases.
- **20.** (d) Due to the electronegativity difference.
- 21. (a) We know that greater the difference in electronegativity of two atoms forming a

covalent bond. More is its polar nature. In HF there is a much difference in the electronegatives of hydrogen and flourine. Therefore (HF) is a polar compound.

- **22.** (c) Silicon tetrafloride has a centre of symmetry.
- **23.** (d)  $BF_3$  have zero dipole moment.
- **25.** (b) According to Fajan's rule largest cation and smallest anion form ionic bond.
- **26.** (b) Polarity character is due to the difference in electronegativity of two atoms or molecule.

## Overlaping- $\sigma$ and $\pi$ - bonds

- 1. (c)  $H \bigoplus_{T}^{\pi} C$
- **2.** (c) In fluorine molecule formation *p-p* orbitals take part in bond formation.
- 3. (b)  $\pi$ -bond is formed by lateral overlapping of unhybridised p-p orbitals.
- 4. (b)  $Ca = \begin{bmatrix} C \\ \parallel \end{bmatrix} 1\sigma$  and  $2\pi$
- 5. (c) In a double bond connecting two atom sharing of 4 electrons take place as in  $H_2C = CH_2$ .
- **6.** (c)  $C \equiv C$  is a multiple bond so it is strongest.
- 9. (d) As the bond order increases, C-H bond energy also increases so it will be greatest in acetylene because its B.O. is 3.
- 11. (b)  $H C \equiv C C = C$
- $16. (a) N \stackrel{\pi}{\longrightarrow} N$
- 17. (d) We know that trisilylamine is  $sp^2$ -hybridized therefore  $p\pi d\pi$  bonding is possible due to the availability of vacant *d*-orbitals with silicon.
- **19.** (d) : O = S = O: 5 atoms has 12 electrons in its O:

outermost shell. One  $(S-O)\pi$  bond will be (p-p)  $\pi$  bond while two  $(S-O)\pi$  bond will be (p-d)  $\pi$  bond.

**20.** (d) Structure of  $P_4O_{10}$  is

Each phosphorus is attached to 4 oxygen atoms.

#### **Hybridisation**

- 1. (d)  $H_2O$  is not linear because oxygen is  $sp^3$  hybridised in  $H_2O$ .
- 2. (d) 0 95.7 pm (104.5) H
- **4.** (c)  $CO_2$  has sp hybridization and is linear.
- 5. (d) No. of  $e^-$  pair =  $3 + \frac{1}{2}[3 3] = 0$ No. of  $e^-$  pair = 3 + 0 120° F

  120°

  F

No. of atom bonded to the central atom = 3 In case of 3, 3 geometry is Trigonal planar.

- **6.** (a) In  $sp^3$  -hybridisation each  $sp^3$  hybridised orbital has 1/4 *s*-character.
- **8.** (b) In ethylene both Carbon atoms are  $sp^2$ -hybridised so  $120^{\circ}$ .
- **9.** (d) Structure of  $sp^3d$  hybridized compound is Trigonal bipyramidal.
- 10. (d) In  $H-C=\stackrel{\parallel}{C}-O-H$  the asterisked carbon has a valency of 5 and hence this formula is not correct.
- **11.** (d)  $dsp^3$  hybrid orbitals have bond angles  $120^{\circ},90^{\circ}$ .
- 13. (a) In  $BeF_3^-$ , Be is not  $sp^3$  -hybridised it is  $sp^2$  hybridised.
- 17. (c) In molecule  $OF_2$  oxygen is  $sp^3$  hybridised.

- **18.** (a) In  $sp^3$  hybrid orbitals *s*-character is  $1/4^{\text{th}}$  means 25%.
- **19.** (d)  $XeF_4$  molecule has 'Xe'  $sp^3d^2$  hybridised and its shape is square planar.
- **20.** (b) The bond angle is maximum for sp hybridisation because two sp hybridised orbitals lies at angle of  $180^{\circ}$ .
- **21.** (c)  $C_2H_4Br_2$  has all single bonds so C-H bond distance is the largest.
- **23.** (a) In methane molecule C is  $sp^3$  hybridised so its shape will be tetrahedral.
- **24.** (c) In compound  ${}^{3}CH_{2} = {}^{2}C = {}^{1}CH_{2}$  the second carbon *sp*-hybridised.
- **25.** (a) :  $\overset{\circ}{Cl}$ : is the correct electronic formula of  $\overset{\circ}{Cl_2}$  molecule because each chlorine has 7 electrons in its valence shell.
- **26.** (a)  $XeF_4$  has  $sp^3d^2$  hybridisation, its shape is square planar.
- **27.** (b) In *HCHO*, carbon is  $sp^2$  hybridized

$$H - \frac{H}{C_{sp^2}} = O$$

- **28.** (c) Because of the triple bond, the carbon-carbon bond distance in ethyne is shortest.
- **29.** (b) The hybridisation of Ag in complex  $[Ag(NH_3)_2]^+$  will be sp because it is a Linear complex.
- **30.** (a) Structure of  $CO_2$  is linear O=C=O while that of  $H_2O$  is H i.e. bent structure so in  $CO_2$  resultant dipole moment is zero while that of  $H_2O$  has some value.
- **31.** (d)  $CO_2$  is not  $sp^3$  hybridised, it is sp hybridised.
- **32.** (a) As compare to pure atomic orbitals, hybrid orbitals have low energy.
- **33.** (d)  $CH_2 = C = CH CH_3$  1, 2-butadiene.
- **36.** (b)  $CCl_4$  is  $sp^3$  hybridised so bond angle will be approximately  $109^{\circ}$ .
- **40.** (b) Ethene has  $sp^2$  hybridised carbon so bond angles are  $120^{\circ}$ .
- **44.** (a) Acetate ion is  $CH_3$  C i.e. one C-O single bond and one C=O double bond.

- **46.** (c) Benzene has all carbons  $sp^2$  hybridised and planar in shape.
- **47.** (d) In methane C is  $sp^3$  hybridized and bond angle is  $109^{\circ}$ .

56. (d) 
$$H - \begin{matrix} H & H & H \\ | & | & | \\ C - C - C - H \\ | & | & H \end{matrix}$$

There are 10 shared pairs of electrons.

- **58.** (a) The diborane molecule has two types of B H bond:
  - (i)  $B H_t$  It is a normal covalent bond.
  - (ii)  $B H_b$  It is a three centred bond.

- **61.** (b)  $PF_5$  involves  $sp^3d$  hybridization and hence has trigonal bipyramidal structure.
- **62.** (c) s-character in  $sp = \frac{1}{2} \times 100 = 50\%$ s-character in  $sp^2 = \frac{1}{3} \times 100 = 33.3\%$ s-character in  $sp^3 = \frac{1}{4} \times 100 = 25\%$

Hence, maximum s-character is found in *sp*-hybridisation.

- **63.** (b) The molecule of  $PCl_5$  has  $sp^3d$  hybridisation, structure is trigonal bipyramidal.
- **64.** (b) Merging (mixing) of dissimilar orbitals of different energies to form new orbitals is known as hybridisation and the new orbital formed are known as hybrid oribitals. They have similar energy.
- **65.** (b) In  $SO_3$  sulphur is  $sp^2$  hybridized so its shape will be trigonal planar.
- **66.** (a) These all are triangular with  $sp^2$  hybridization.
- **67.** (c) Bond length depends upon bond order and in benzene all C-C bonds have same bond order.
- **68.** (b) In  $C_2H_2$  each carbon has sp -hybridization  $H-C\underset{sp}{=}C-H$
- **70.** (a) As *p*-character increases the bond angle decreases.

In 
$$sp$$
 -  $p$ -character  $\frac{1}{2}$ , bond angle -  $180^{o}$ 

In 
$$sp^2$$
 -  $p$ -character  $\frac{2}{3}$ , bond angle -  $120^o$ 

In 
$$sp^3$$
 -  $p$ -character  $\frac{3}{4}$ , bond angle -  $109^o$ 

- **71.** (a)  $sp^3$  -hybridization called tetrahedral because it provides tetrahedral shape to the molecule.
- **72.** (a) *S*-atom in  $SF_6$  has  $sp^3d^2$  hybridisation. So, the structure of  $SF_6$  will be octahedral.
- **74.** (b) Structure of  $H_2O_2$  is non-planar. It has open book structure.
- **75.** (d) Structure of  $N_2O$  is similar to  $CO_2$  both have linear structure.
- **78.** (a)  $SnCl_2$  is V-shaped.
- **79.** (d) In  $NH_4^+$  nitrogen is  $sp^3$  hybridised so 4 hydrogen situated at the corners of a tetrahedron.
- **81.** (c) Increasing order of bond angle is  $sp^3 < sp^2 < sp_{109^\circ} \atop 120^\circ \atop 180^\circ$
- **84.** (a)  $NH_4^+$  has  $sp^3$  -hybridized nitrogen so its shape is tetrahedral.
- **86.** (b) Bond angle increases with change in hybridisation in following order  $sp^3 < sp^2 < sp$ .
- **88.** (c) In Diborane boron shows  $sp^3$  -hybridization.
- **89.** (a) Alkene does not show linear structure but it has planar structure due to  $sp^2$  -hybridisation.
- **90.** (c) Generally  $SF_4$  consist of 10 electrons, 4 bonding electron pair and one lone pair of electron, hence it shows  $sp^3d$  hybridization.
- 92. (c) Atom/Ion Hybridisation  $NO_2^+$  sp  $SF_4$   $sp^3d$  with one lone pair or electron  $PF_6^ sp^3d^2$
- 93. (a)  $PF_3$  consist of three bonding pair electrons and one lone pair of electron hence it shows  $sp^3$  hybridization.
- **94.** (b)  $NO_2^+$  shows sp-hybridization. So its shape is linear.
- **95.** (c) Generally octahedral compound show  $sp^3d^2$  hybridization.
- **96.** (a) In fifth group hydride bond angle decreases from top to bottom

$$NH_3 > PH_3 > AsH_3 > SbH_3 > BiH_3$$
.

- **97.** (b) Generally  $NH_4^+$  shows  $sp^3$  hybridization.
- **98.** (b) We know that single, double and triple bond lengths of carbon in carbon dioxide are 1.22 Å,1.15 Å and 1.10Å respectively.
- **99.** (b) It shows  $sp^2$ -hybridization so it is planar.
- **101.** (a) Bond angle of hydrides decreases down the group.
- **102.** (b) Hybridization of N in  $NH_3$  is  $sp^3$  that of Pt in  $[PtCl_4]^{2-}$  is  $dsp^2$  that P in  $PCl_5$  is  $sp^3d$  and that of B in  $BCl_3$  is  $sp^2$ .
- 103. (d)  $NH_4^+$  and  $SO_4^{2-}$  both show  $sp^3$  -hybridization and tetrahedral structure.
- **104.** (a) It is shows  $sp^3d^3$  –hybridization. Hence the bond angle is about 72°.
- **107.** (a) *s*-character increases with increase in bond angle.

| Hybridization | s%   | Angle                  |
|---------------|------|------------------------|
| sp            | 50   | 180 °                  |
| $sp^2$        | 33.3 | 120 °                  |
| $sp^3$        | 25   | 109.28°                |
| $sp^3d^1$     | 20   | $90^{o}$ and $120^{o}$ |

- **108.** (b)  $IF_7$  molecule show  $sp^3d^3$  -hybridization.
- **110.** (a)  $PCl_3$  contain three bonding and one lone pair electron. Hence shows  $sp^3$  -hybridization.
- **111.** (a) Ammonia and  $(BF_4)^{-1}$  shows  $sp^3$  hybridization.
- 112. (b) For square planar geometry hybridization is  $dsp^2$  involving  $s, p_x, p_y$  and  $d_{x^2-y^2}$  orbital.
- 113. (b) All carbon atoms of benzene consist of alternate single and double bond and show  $sp^2$  hybridization.
- **116.** (c)  $BCl_3$  molecule show  $sp^2$ -hybridization and planar structure.
- **117.** (c)  $BCl_3$  Boron trichloride molecule show  $sp^2$  hybridization and trigonal planar structure.
- 118. (b)  $SO_2$  molecule shows  $sp^2$ -hybridization and bent structure.
- **119.** (c) Due to multiple bonding in  $N_2$  molecule.
- **120.** (a) % of *s*-character in

$$CH_4 = \frac{100}{4} = 25$$
,  $C_2H_4 = \frac{100}{3} = 33$ ,

$$C_2 H_2 = \frac{100}{2} = 50$$

- **121.** (a) Acidic character increases when we come down a group, so HI is the strongest acid.
- 122. (c)  $SO_2$  has  $sp^2$  hybridization have the V shape structure (<120°) due to 2 lone pair of electron over S atom.  $CO_2$  and  $N_2O$  have the sp hybridization.
- **123.** (a) In  $H_2CO_3$  and  $BF_3$  central atom are in  $sp^2$  hybridization but in  $H_2CO_3$  due to the ionic character of O-H bond it will be polar (High electronegativity of oxygen).
- **124.** (a) Due to  $sp^3$  hybridization and presence of lone pair of electron on p atom  $PCl_3$  are of pyramidal shape like that of  $NH_3$ .
- **125.** (b) There is sp hybridization in  $C_2H_2$  so it has the linear structure.
- **126.** (c) In octahedral molecule six hybrid orbitals directed towards the corner of a regular octahedron with a bond angle of 90°.

according to this geometry, the number of X-M-X bond at 180° must be three.

- **127.** (d)  $sp^3d^2$  hybrid orbital have octahedral shape
- **128.** (c) In the formation of  $d^2sp^3$  hybrid orbitals two (n-1)d orbitals of *e.g.*, set [*i.e.*,  $(n-1)dz^2$  and  $(n-1)dx^2-y^2$  orbitals] one ns and three np [ $np_x,np_y$  and  $np_z$ ] orbitals combine together and form six  $d^2sp^3$  hybrid orbitals.
- **129.** (c) The correct order of bond angle (Smallest first) is

$$H_2S < NH_3 < SiH_4 < BF_3$$

92.6° < 107° < 109°28' < 120°

**130.** (a)

Square planar

See saw shaped

Square planar

**131.** (b)

- **132.** (b) In the formation of  $BF_3$  molecule, one s and 2p orbital hybridise. Therefore it is  $sp^2$  hybridization.
- **133.** (e) In  $NCl_3$  and  $H_2S$  the central atom of both (N and S) are in  $sp^3$  hybridization state

while in  $BF_3$  and  $NCl_3$  central atoms are in  $sp^2$  and  $sp^3$  hybridization respectively. In  $H_2S$  and  $BeCl_2$  central atom are in  $sp^3$  and  $sp^2$  hybridization In  $BF_3$ ,  $NCl_3$  &  $H_2S$  central atom are in  $sp^2$ ,  $sp^3$  &  $sp^3$  hybridization and in the central atom are in  $sp^3$  and sp hybridization.

**134.** (c)  $C_{\text{ground state}} = 2s^2, 2p_x^{-1}p_y^{-1}$ ;  $C_{\text{excited state}} = 2s^1, 2p_x^{-1}p_y^{-1}p_z^{-1}$  $O_{\text{ground state}} = 2s^2, 2p_x^{-2}p_y^{-1}p_z^{-1}$ 

In the formation of  ${\it CO}_2$  molecule, hybridization of orbitals of carbon occur only to a limited extent involving only one s and one p orbitals there is thus sp hybridisation of valence shell orbitals of the carbon atom resulting in the formation of two sp hybrid orbitals.

- **135.** (d) In  $NH_3$ , N undergoes  $sp^3$  hybridization. Due to the presence of one lone pair, it is pyramidal in shape.
- **136.** (b)  $NO_2$   $SF_4$   $PF_6^-$  sp  $sp^3d$   $sp^3d^2$
- **137.** (b) The configuration of  ${}_{5}B = 1s^{2}, 2s^{2}2p^{1}$

138. (d) In  $SO_3$  molecule, S atom remains  $sp^2$  hybrid, hence it has trigonal planar struct@re

139. (a) In  $PCl_3$  molecule, phosphorous is  $sp^3$  – hybridised but due to presence of lone pair of electron, it has pyramidal structure

140. (a) The electronic configuration of

 $IF_7$  shows  $sp^3d^2$  hybridization. So, its structure is pentagonal bipyramidal.

141. (a) Compound containing highly electronegative element (F, O, N) attached to an electropositive element (H) show hydrogen bonding. Fluorine (F) is highly electronegative and has smaller size. So hydrogen fluoride shows the strongest hydrogen bonding in the liquid phase.

142. (b) In the ammonia molecule N atom is  $sp^3$  – hybridized but due to the presence of one lone pair of  $e^-$  (i.e. due to greater  $L_p - b_p$  repulsion) it has distorted tetrahedral (or pyramidal) geometry.

**143.** (a)  $_{4}Be \rightarrow 1s^{2}, 2s^{2}, 2p^{0}$ 

- **144.** (a) Except  $CO_3$  other choice  $CO_2$ ,  $CS_2$  and  $BeCl_2$  have sp-hybridization and shows the linear structure while  $CO_3$  have  $sp^3$  hybridization and show the non linear structure because  $sp^3$  generate tetrahedral structure.
- **145.** (a)  $dsp^3$  or  $sp^3d$  hybridization exhibit trigonal bipyramidal geometry *e.g.*,  $PCl_5$

- **146.** (b) Carbon has only two unpaired electrons by its configuration but hybridization is a concept by which we can explain its valency 4.
- **147.** (c) Hybridization is due to overlapping of orbitals of same energy content.
- **148.** (d)  $MX_3$  show the  $sp^2$  hybridization in which  $3sp^2$  hybridized orbital of M bonded by 3X from  $\sigma$  bond and having the zero dipole moment.
- 149. (bcd)  $SnCl_2$  has V-shaped geometry.
- **150.** (a)  $NF_3$  is predominantly covalent in nature and has pyramidal structure (the central atom is

 $sp^3$  hybridised) with a lone pair of electrons in the fourth orbital.

- **151.** (ac)  $PCl_3, NH_3 \rightarrow Pyramidal.$  $CH_A$ ,  $CCl_A \rightarrow Tetrahedral$ .
- **152.** (a)  $dsp^{3}$  or  $sp^{3}d$ : one  $s^{+}$  three  $p^{+}$  one  $d(d_{2})$ .

#### Resonance

- (d) Choice (a), (b), (c) are the resonance 1. structures of  $CO_2$ .
- (b) In  $NH_3$  nitrogen has one lone pair of electron. 2.
- (b) In  $CN^-$  ion formal negative charge is on 5. nitrogen atom due to lone pair of electrons.

$$O-H$$

- (a)  $CH_3 C = CH_2$  has  $9\sigma$ ,  $1\pi$  and 2 lone pairs. 7.
- (c) In resonance structure there should be the 8. same number of electron pairs.
- (b) There are three resonance structure of  $CO_3^{2-}$ 9. ion.

(abcd) It has all the characteristics. 11.

#### **VSEPR Theory**

- (a) The bond angle in  $PH_3$  would be expected to 2. be close to  $90^{\circ}$ . (The bond angle H-P-H in  $PH_3$  is  $93^{\circ}$ )
- (b) In  $BF_3$  molecule Boron is  $sp^2$  hybridised so its 3. all atoms are co-planar.
- (c) Due to lp lp repulsions, bond angle in  $H_2O$  is 4. lower  $(104^{\circ}.5^{\circ})$  than that in  $NH_3$   $(107^{\circ})$  and  $CH_4(109^{\circ}28')$ .  $BeF_2$  on the other hand, has sphybridization and hence has a bond angle of  $180^{\,o}$  .
- (c) Compound is carbontetrachloride because 5.  $CCl_4$  has  $sp^3$  -hybridization 4 orbitals giving regular tetrahedron geometry. In others the geometry is little distorted inspite of sp<sup>3</sup> hybridization due to different atoms on the vertices of tetrahedron.
- (b)  $SO_4^{2-}$  ion is tetrahedral since hybridization of 6.
- 7. (b)  $NH_3$  molecule has one lone pair of electrons on the central atom i.e. Nitrogen.

- (c)  $C_2H_2$  has linear structure because carbons 8. are sp-hybridised and lies at  $180^{\circ}$ .
- (b)  $XeF_6$  is distorted Octahedral. It has  $sp^3d^3$ 9. hybridisation with lone pair of electron on Xe, so its shape is distorted.
- 10. (a)
- (c) Xe ground state 11.

 $XeF_{\Lambda}$ 

 $sp^3d^2$  - hybridization

- (a)  $CO_2$  has bond angle  $180^{\circ}$ .
- (a) As the s-character of hybridized orbitals 13. decreases the bond angle also decreases In  $sp^3$  hybridisation: s-character 1/4, bond angle 109°

In  $sp^2$  hybridisation: s-character 1/3, bond angle 120°

In sp hybridisation: s-character 1/2, bond angle 180°

- (a)  $XeF_2$  molecule is Linear because Xe is sphybridised.
- (c)  $SO_4^{2-}$  has 42 electrons;  $CO_3^{2-}$  has 32 electrons; 15.  $NO_3^-$  has 32 electrons.
- 16. (c) Molecular oxygen contains unpaired electron so it is paramagnetic (according to MOT).
- (b) Structure of  $H_2O$  is a bent structure due to 17. repulsion of lone pair of oxygen.
- (d) Bond angle between two hybrid orbitals is 105° it means orbitals are sp<sup>3</sup> hybridised but to lone pair repulsion bond angle get changed from  $109^{\circ}$  to  $105^{\circ}$ . So its % of s-character is between 22-23%.
- **22.** (d) Number of electrons in  $ClO_2^-$

$$= 7 + 6 + 6 + 1 = 20$$

Number of electrons in  $ClF_2^+ = 7+7+7$  -

1=20.

23. (b) Central atom having four electron pairs will be of tetrahedral shape.

**26.** (c) It shows  $sp^2$ -hybridization and show trigonal planar structure.

- **28.** (b)  $H_2S$  show bond angle nearly 90°.
- 31. (a) Bond angle of hydrides is decreases top to bottom in the group.  $NH_3 > PH_3 > AsH_3 > SbH_3$
- **33.** (c) Unpaired electrons are present in  $KO_2$  while others have paired electron  $NO_2^+ = 22$  electrons;  $BaO_2 = 72$  electrons  $AlO_2 = 30$  electrons;  $KO_2 = 35$  electrons
- **34.** (a) Bond angle decreases from  $H_2O$  to  $H_2Te$ .
- **35.** (c)  $BF_3$  does not contain lone pair of electron.
- **36.** (b)

Bent *T*-shaped geometry in which both lone pairs occupy the equatorial position of the trigonal bipyramidal here  $(l_p - l_p)$  repulsion = 0  $(l_p - b_p)$  repulsion = 4 and

- (b) The overall value of the dipole moment of a polar molecule depends on its geometry and shape *i.e.*, vectorial addition of dipole moment of the constituent bonds water has angular structure with bond angle 105° as it has dipole moment. However BeF<sub>2</sub> is a linear molecule since dipole moment summation of all the bonds present in the molecule cancel each other.
- **38.** (d)  $BCl_3$ ,  $BBr_3$  and  $BF_3$ , all of these have same structure *i.e.* trigonal planar ( $sp^2$  hybridization) Hence bond angle is same for all of them (*i.e.*, equal to 120°)
- **39.** (d) We know that molecule of  $(NH_3)$  has maximum repulsion due to lone pair of electron. Its shape is pyramidal and is  $sp^3$  hybridization.
- **40.** (b)

As the electronegativity of central atom decreases bond angle is decreases

- $\therefore$  NH<sub>3</sub> has largest bond angle.
- **41.** (c) In  $NH_3$ ,  $sp^3$  -hybridization is present but bond angle is  $106^{\circ}45'$  because Nitrogen has lone pair of electron according to VSEPR theory due to bp-lp repulsion bond angle decreases from  $109^{\circ}45'$  to  $106^{\circ}45'$ .
- **42.** (a) Bond strength decreases as the size of the halogen increases from *F* to *I*.
- **43.** (b)  $NH_3$  has pyramidal structure, yet nitrogen is  $sp^3$  hybridised. This is due to the presence of lone pair of electron.
- 44. (c)  $SiF_4$  has symmetrical tetrahedral shape which is due to  $sp^3$  hybridization of the central sulphur atom in its excited state configuration.  $SF_4$  has distorted tetrahedral or Sea- Saw geometry which arise due to  $sp^3d$  hybridization of central sulphur atom and due to the presence of lone pair of electron in one of the equatorial hybrid orbital.
- **45.** (d)

dsp<sup>2</sup>
hybridization
(Four 90°
angles between

sp³d hybridization (Six 90° angle between bond

 $sp^3d^2$ hybridization (Twelve 90° angle between

## Molecular orbital theory

- 2. (c) B.O. =  $\frac{\text{No. of bonding } e^{-} \text{No. of antibondin g } e^{-}}{2}$ =  $\frac{8-3}{2} = \frac{5}{2} = 2.5$ .
- 3. (b) One bonding M.O. and one anti-bonding M.O.
- **4.** (b)  $O_2^{2-}$  is least stable.
- **5.** (c) B.O. of  $O_2$  is 2, B.O. of  $O_2^{-1}$  is 1.5, B.O. of  $O_2^{+1}$  is 2.5 and of  $O_2^{2-}$  is 1.
- **6.** (d) Hydride of boron does not exist in  $BH_3$  form. It is stable as its dimer di borane  $(B_2H_6)$ .
- 10. (c)  $O_2^-(2 \times 8 + 1 = 17)$  has odd number of electrons and hence it is paramagnetic. All the remaining molecules/ions, *i.e.*,  $CN^-(6+7+1=14)$  diamagnetic NO(7+8=15) has odd number of electrons and hence it is paramagnetic.
- 11. (c) B.O. =  $\frac{\text{No. of } N_b \text{No. of } N_a}{2} = \frac{5}{2} = 2.5$ .
- **12.** (b) Bond order of  $O_2^+$  is highest so its bond length is smallest.

**13.** (c) Oxygen is paramagnetic due to the presence of two unpaired electron :

$$\begin{split} O_2 &= \sigma(1s)^2 \, \sigma^*(1s)^2 \, \sigma(2s)^2 \, \sigma^*(2s)^2 \\ \sigma(2p_x)^2 \, \pi(2p_y)^2 \, \pi(2p_x)^2 \, \pi^*(2p_y)^1 \, \pi^*(2p_z)^1 \end{split}$$

- 17. (d) In  $CH_3CN$  bond order between C and N is 3 so its bond length is minimum.
- **18.** (b)

(P = Paramagnetic, D = Diamagnetic)

- **19.** (c) Due to unpaired  $e^ ClO_2$  is paramagnetic.
- **20.** (c) The Bond order in  $N_2$  molecule is 3,  $N \equiv N$  Here,  $N_b = 2+4+2=8$  and  $N_a = 2$   $\therefore$  B.O. =(8-2)/2=3.
- **21.** (d)  $H_2^+$  has the bond order  $\frac{1}{2}$ , it has only one electron so it will be paramagnetic.
- 22. (c) When bond forms between two atom then their energy get lower than that of separate atoms because bond formation is an exothermic process.
- **23.** (b) Valency of A is 3 while that of B is 2 so according to Criss Cross rule the formula of the compound between these two will be  $A_2B_3$ .
- **24.** (c) Due to resonance bond order of C-C bonds in benzene is between 1 and 2.
- **25.** (a) Nitrogen does not have vacant 'd'-orbitals so it can't have +5 oxidation state i.e. the reason  $PCl_5$  exists but  $NCl_5$  does not.
- **26.** (d) Molecules having unpaired electrons show paramagnetism.
- **27.** (b)  $NO_2$  has unpaired electrons so it would be paramagnetic.
- **30.** (c) Helium molecule does not exist as bond order of  $He_2 = 0$ .
- **31.** (c) Structure of  $P_4O_{10}$  is

Each phosphorus is attached to 4 oxygen atoms.

- **33.** (c) B.O. of carbon  $=\frac{N_b N_a}{2} = \frac{8 4}{2} = 2$ .
- **34.** (a) B.O. =  $\frac{N_b N_a}{2} = \frac{10 4}{2} = 3$ .
- **37.** (b) B.O.  $=\frac{N_b N_a}{2} = \frac{8-3}{2} = \frac{5}{2} = 2.5$ .
- 38. (a) Electronic configuration of  $O_2$  is  $O_2 = \sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2s)^2 \sigma(2p_x)^2 \pi(2p_y)^2$  $\pi(2p_z)^2 \pi^*(2p_y)^1 \pi^*(2p_z)^1$

The molecule has two unpaired electrons So, it is paramagnetic

- **40.** (c)  $\pi^2 2p_y$  has two nodal planes.
- **42.** (a) Element with atomic number 26 is *Fe*. It is a ferromagnetic.
- **43.** (b) Correct Sequence of bond order is

$$O_2^+ > O_2 > O_2^{2-}$$
  
B.O - 2.5 2 1.5

- 44. (a) Due to small bond length.
- **45.** (a)  $S^{-2}$  have all paired electrons so it is diamagnetic.
- **46.** (c) *NO* has 15 electrons.
- **47.** (b) In the conversion of  $O_2$  into  $O_2^-$  bond order decreases.
- **49.** (c)  $O_2^{2-}$  does not have any unpaired electron so it is diamagnetic.
- **50.** (a)  $O_2^{2-}$  consist of four antibonding electron pair [1s and 2s have two antibonding and  $2p_x 2p_y$  have two antibonding electron pair].
- 51. (c) The electron's distribution in molecular orbitals is  $1s^2, 2s^1$

B.O. 
$$=\frac{2-1}{2}=\frac{1}{2}=0.5$$
.

- **52.** (b)  $ClO_2^-$  has all paired electrons hence it does not show paramagnetism.
- **53.** (a) B.O. =  $\frac{1}{2}[N_b N_a]$  $N_2 = \frac{1}{2}[10 - 4] = \frac{6}{2} = 3$ ;  $O_2^{2+} = \frac{1}{2}[10 - 4] = \frac{6}{2} = 3$ .
- **54.** (a) B.O. for  $N_2^+ = \frac{1}{2}[N_b N_a] = \frac{1}{2}[9 4] = \frac{5}{2} = 2.5$ .
- **55.** (a)  $H_2O_2$  contain bond angle between two O-H planes about  $90^{\circ}$ .
- **56.** (c) Nitrogen molecule has highest bond energy due to presence of triple bond.
- **57.** (c)  $Cu^{2+} = [Ar_{18}]3d^9 4s^0$  it has one unpaired electron so it is paramagnetic.
- **59.** (a)  $CN^- = 14$  electrons; CO = 14 electrons B.O.  $= \frac{1}{2}[10 - 4] = \frac{6}{2} = 3$ .

**61.** (a) 
$$P = P$$

64. (c) The paramagnetic property in oxygen came through unpaired electron which can be explained by molecular oxplite theory.

So 2 unpaired of electron present in  $\pi \ 2p_y^*$  and  $\pi \ 2p_z^*$ .

65. (a) Bond order =  $\frac{\text{Total number of bonds between atoms}}{\text{Total number of resonating structure}}$ =  $\frac{5}{4} = 1.25$ 

**66.** (c) We know that carbonate ion has following resonating structures

Bond order =  $\frac{\text{Total number of bonds between atoms}}{\text{Total number of resonating structure}}$ =  $\frac{1+1+2}{3} = \frac{4}{3} = 1.33$ .

**67.** (a)  $O_2^+(15e^-) = K : K^*(\sigma 2s)^2(\sigma^* 2s)^2(\sigma 2p_x)^2$   $(\pi 2p_y)^2(\pi 2p_z)^2(\pi^* 2p_y)^1(\pi^* 2p_z)^0$ Hence, bond order  $= \frac{1}{2}(10-5) = 2.5$   $N_2^+(13e^-) = KK^*(\sigma 2s)^2(\sigma^* 2s)^2(\sigma 2p_x)^2$   $(\pi 2p_y)^2(\pi 2p_z)^1$ Hence, bond order  $= \frac{1}{2}(9-4) = 2.5$ .

**68.** (a) Electronic configuration of  $O_2$  is  $O_2 = (\sigma 1s)^2 (\sigma^* 1s)^2 (\sigma 2s)^2 (\sigma^* 2s)^2 (\sigma^* 2s)^2 (\sigma 2p_z)^2$  $(\pi 2p_x^2 = \pi 2p_y^2) (\pi^* 2p_x^1 = \pi^* 2p_y^1)$ 

Hence bond order  $=\frac{1}{2}[N_b - N_a] = \frac{1}{2}[10 - 6] = 2$ .

**69.** (c) Nitrogen form triple bond  $N \equiv N$  In which 6 electron take part.

**70.** (a) As bond order increase bond length decrease the bond order of species are

 $= \frac{\text{number of bonding electron - Number of } a.b. \text{ electron}}{2}$ 

For 
$$O_2 = \frac{10-6}{2} = 2$$
;  $O_2^+ = \frac{10-5}{2} = 2.5$ 

$$O_2^- = \frac{10-7}{2} = 1.5$$

So, bond order  $O_2^+ > O_2 > O_2^-$  and bond length are  $O_2^+ > O_2 > O_2^-$ .

71. (b)  $\sigma 1s^{2}, \sigma^{*}1s^{2}, \sigma 2s^{2}, \sigma^{*}2s^{2}, \sigma 2p_{x}^{2} \qquad \pi^{*}2p_{y}^{2} \quad \pi^{*}2p_{y}^{1}$   $\pi 2p_{z}^{2} \quad \pi^{*}2p_{z}^{1}$ 

Bond order =  $\frac{10-6}{2}$  = 2.0

(Two unpaired electrons in antibonding molecular orbital)

$$O_2^+: \sigma 1s^2, \sigma^* 1s^2, \sigma 2s^2, \sigma^* 2s^2, \sigma 2p_x^2 \begin{cases} \pi 2py^2 \begin{cases} \pi^* 2py^1 \\ \pi 2pz^2 \end{cases} \begin{cases} \pi^* 2pz^0 \end{cases}$$

Bond order 
$$=\frac{10-5}{2}=2.5$$

(One unpaired electron in antibonding molecular orbital so it is paramagnetic)

**72.** (b) Higher the bond order, shorter will be the bond length, thus  $NO^+$  having the higher bond order that is 3 as compared to NO having bond order 2 so  $NO^+$  has shorter bond length.

73. (d) Oxygen molecule  $(O_2)$  boron molecule  $(B_2)$  and  $N_2^+$  ion, all of them have unpaired electron, hence they all are paramagnetic.

**74.** (c) Bond order of  $NO^+, NO$  and  $NO^-$  are 3, 2.5 and 2 respectively, bond energy  $\infty$  bond order

**75.** (a) Paramagnetic property arise through unpaired electron.  $B_2$  molecule have the unpaired electron so it show paramagnetism.

$$B_2 \rightarrow \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \pi 2p_x^{-1} = \pi 2p_y^{-1}$$
(2 unpaired electron)

$$C_2 \rightarrow \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \pi 2p_x^2.\pi 2p_y^2$$
(No unpaired electron)

$$N_2 \rightarrow \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2{p_x}^2, \pi 2{p_y}^2 \pi 2{p_z}^2$$
(No unpaired electron)

$$F_{2} \to \sigma\!s^{2}, \sigma^{*}1s^{2}, \sigma2s^{2}, \sigma^{*}2s^{2}, \sigma2p_{_{X}}^{^{2}}, \pi2p_{_{y}}^{^{2}}, \pi2p_{_{z}}^{^{2}}, \\ \text{(No unpaired electron)}$$

$$\pi^* 2p_y^2, \pi^* 2p_z^2$$

So only  $B_2$  exist unpaired electron and show the paramagnetism.

**76.** (b)

$$O_{2} \to \sigma 1s^{2}, \sigma^{*} 1s^{2}, \sigma 2s^{2}, \sigma^{*} 2s^{2}, \pi 2p_{x}^{2}$$

$$\pi 2p_{y}^{2} \pi \left\{ 2p_{y}^{1} \right\} \left\{ \pi 2p_{z}^{2} \pi^{*} 2p_{z}^{2} \right\}$$

So two unpaired electron found in  ${\cal O}_2$  at ground stage by which it shows paramagnetism.

- **77.** (b) Due to greater electron affinity  $Cl_2$  has the highest bond energy.
- **78.** (a) Molecular orbital electronic configuration of these species are :

$$O_2^-(17e^-) = \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2p_x^2, \pi 2p_y^2,$$

$$\pi 2p_z^2, \pi^* 2p_y^2 \pi^* 2p_z^1$$

$$O_2(16e) = \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2p_x^2, \pi 2p_y^2,$$

$$\pi 2p_z^2 \pi^* 2p_y^1 \pi^* 2p_z^1$$

$$O_2^{2-}(18e) = \sigma 1s^2 \sigma^* 1s^2, \sigma 2s^2 \sigma^* 2s^2, \sigma 2p_x^2, \pi 2p_y^2,$$

$$\pi 2p_z^2 \pi^* 2p_y^2 \pi^* 2p_z^2$$

Hence number of antibonding electrons are 7,6,and 8 respectively.

- **79.** (c) Species with unpaired electrons is paramagnetic  $O_2$  has 2 unpaired electrons,  $O_2^-$  has one unpaired,  $O_2^{2-}$  has zero unpaired electrons,  $O_2^{2+}$  has one unpaired.
- **80.** (a)  $O_2$  has 2 unpaired electron while  $O_2^+$  and  $O_2^-$  has one each unpaired electrons while  $O_2^{2+}$  does not have any unpaired electron.

**81.** (c) 
$$H - O - O - H$$
,  $O \leftarrow O = O$ ,  $O = O$ 

Due to resonance in  $O_3$  O-O bond length will be in b/w O=O and O-O.

**82.** (a) From valency bond theory, bond order in CO,  $i.e.: C \equiv 0$ : is 3, that of O = C = 0 is 2 while that of  $CO_3^{2-}$  ion is 1.33. Since the bond length increases as the bond order decreases, *i.e.*  $CO < CO_2 < CO_3^{2-}$ .

**83.** (c) 
$$N_2 : KK\sigma(2s)^2\sigma^*(2s)^2\pi(2p_x)^2\pi(2p_y)^2\sigma(2p_z)^2$$

(diamagnetic)

$$C_2 : KK \sigma(2s)^2 \sigma^*(2s)^2 \pi (2p_x)^2 \pi (2p_y)^2$$
 (diamagnetic)

$$N_2^+: KK\sigma(2s)^2\sigma*(2s)^2\pi(2p_x)^2\pi(2p_y)^2\sigma(2p_z)^2$$

(paramagnetic)

$$O_2^{2-}: KK\sigma(2s)^2 \sigma * (2s)^2 \sigma(2p_z)^2 \pi(2p_x)^2 \pi(2p_y)^2$$

$$\pi * (2p_x)^2 \pi * (2p_y)^2$$
 (diamagnetic)

**84.** (d) 
$$NH_3 = 107^\circ$$
,  $PH_3 = 93^\circ$ ,  $H_2O = 104.5^\circ$   
 $H_2Se = 91^\circ$ ,  $H_2S = 92.5^\circ$ 

## Hydrogen bonding

- (d) Hydrogen bonding will be maximum in F-H bond due to greater electronegativity difference.
- 2. (b) Ice has hydrogen bonding.
- 3. (b) H F has highest boiling point because it has hydrogen bonding.
- **6.** (d)  $CO_2$  is *sp*-hybridised
- 7. (b) sp-hybridization gives two orbitals at  $180^{\circ}$  with Linear structure.
- **8.** (d) Hydrogen bonding increases the boiling point of compound.
- 9. (c) o-Nitrophenol has intramolecular hydrogen bonding but p-Nitrophenol has intermolecular hydrogen bonding so boiling point of p-Nitrophenol is more than o-Nitrophenol.
- 10. (c) The strongest hydrogen bond is in hydrogen fluoride because the power of hydrogen bond  $\infty$  electronegativity of atom and

electronegativity 
$$\propto \frac{1}{\text{atomic size}}$$

So fluorine has maximum electronegativity and minimum atomic size.

- 11. (d)  $H_2O$  can form hydrogen bonds rest  $CH_4$  and  $CHCl_3$  are organic compound having no oxygen while NaCl has itself intraionic attraction in the molecule.
- 12. (b)  $PH_3$  has the lowest boiling point because it does not form Hydrogen bond.
- **14.** (b) Hydrogen bonding increases heat of vaporisation.
- **15.** (d) Only  $NH_3$  forms H-bonds.
- **22.** (a) Water molecule has hydrogen bonding so molecules get dissociated so it is liquid.
- **23.** (d) In case of water, five water molecules are attached together through four hydrogen bonding.
- **25.** (c) Hydrogen bond is strongest in hydrogen fluoride.

- **28.** (c) Boiling point of  $H_2O$  is more than that of  $H_2S$  because  $H_2O$  forms hydrogen bonding while  $H_2S$  does not.
- 30. (c)  $O = H^{\delta^+}$   $C = O^+$ Interamolecular *H*-bonding.
- **31.** (a) Hydrogen bond is formed when hydrogen is attached with the atom which is highly electronegative and having small radius.
- **34.** (a) Water is dense than ice because of hydrogen bonding interaction and structure of ice.
- **35.** (a) Ethanol have hydrogen bonding so its boiling point is higher than its isomer dimethyl ether.
- **36.** (a) A compound having maximum electronegative element will form strong Hydrogen bond.
- 37. (a) Due to electronegativity difference of  $N_2$  and  $H_2$ ,  $NH_3$  form hydrogen bond.
- **38.** (b) Intermolecular hydrogen bonding compound contain more b.p. compare to intramolecular hydrogen bonding compound.
- 39. (d) Water molecule contain hydrogen bonding.
- 40. (c) It contain intermolecular hydrogen bonding.
- **41.** (b) Ethyl alcohol has a intermolecular hydrogen bond.
- **43.** (b) *HCl* contain weak covalent bond.
- **45.** (c) Due to intermolecular hydrogen bonding water molecules come close to each other and exist in liquid state.
- **46.** (b) Due to greater resonance stabilization.
- **47.** (d)  $C_2H_5OH$  will dissolve in water because it forms hydrogen bond with water molecule.
- **48.** (b) In ice cube all molecules are held by inter molecular hydrogen bond.
- **49.** (d) Hydrogen bonding is developed due to inter atomic attraction so it is the weakest.

## Types of bonding and Forces in solid

- **1.** (b) In electrovalent crystal has cation and anion are attached by electrostatic forces.
- **2.** (d) Mercury has very weak interatomic forces so it remains in liquid state.
- 3. (c) The melting and boiling points of argon is low hence, in solid argon atoms are held together by weak Vander Waal's forces.
- **4.** (c) *NaF* is the strongest ionic crystal so its melting point would be highest.
- **9.** (b) Diamond is the hardest substance it's melting point would be highest.
- **10.** (c) Bond is formed by attractive and repulsive forces of both the atoms.

- **12.** (a) Generally zero group elements are linked by the Vander Waal's force. Hence these show weakest intermolecular forces.
- **13.** (d) Glycerol has a three *OH* group hence it is viscous in nature.
- **14.** (c) Vander waal's forces is the weakest force of attraction.
- **16.** (b)  $NH_4^+$  contain all three types of bond in its

structure 
$$\begin{bmatrix} H \\ H - \stackrel{|}{N} \to H \\ H \end{bmatrix}^{+}$$

- 17. (d) In NaOH covalent bond is present in O-H bond while ionic bond is formed between  $OH^-$  and  $Na^+$ .
- **18.** (a) Bond formation is an exothermic reaction so there is decrease in energy of product.
- **22.** (d) Blue vitriol is  $CuSO_4.5H_2O$  and it has all types of bonds.

**23.** (a) 
$$\begin{bmatrix} H \\ H - N \rightarrow H \\ H \end{bmatrix}^{+} Cl^{-}$$

Ionic bond = 1, Covalent bond = 3 Co-ordinate bond = 1.

#### **Critical Thinking Questions**

- 1. (d) We know that ionic characters  $= 16 [E_A E_B] + 3.5 \times [E_A E_B]^2$  or ionic characters = 72.24%
- 3. (c) Configuration of  $O_2$  molecule is  $[\sigma(1s)^2 \sigma^*(1s)^2 \sigma(2s)^2 \sigma^*(2s)^2 \pi(2p_x)^2 \pi(2p_y)^2 \\ \sigma(2p_z)^2 \pi^*(2p_x)^1 \pi^*(2p_y)^1]$

No. of pair are 7 so total no. of paired electrons are 14.

6. (a) 
$$H - O : + H^+ \rightarrow H - O \rightarrow H$$
 $H$ 

- 7. (b) The correct order of increasing dipole moment is p-dichlorobenzene < Toluene < m-dichlorobenzene.</p>
- **8.** (a) The dipole moment of  $CH_4=0D$ ,  $NF_3=0.2D$ ,  $NH_3=1.47D$  and  $H_2O=1.85D$ . Therefore the correct order of the dipole moment is  $CH_4< NF_3< NH_3< H_2O$ .
- **10.** (d) Ammonia molecule is more basic than nitrogen trifluoride and Boron trifluoride

because ammonia molecule easily gives lone pair of electron.

- 11. (a) Chlorine atom in  $ClO_2^-$  is  $sp^3$  hybridised but its shape is angular.
- 12. (c)  $[NF_3]$  and  $H_3O^+$  are pyramidal while  $[NO_3^-]$  and  $BF_3$  are planar. Hence answer (c) is
- **13.** (d)  $CH_2 = CH_2 CH_2 CH_2 C \equiv CH_3$   $Sp^2 Sp^3$ hybridised
- 14. (d) B.O. in CO *i.e.*,  $: \overset{-}{C} = \overset{+}{O} :$  is 3, that of O = C = O is 2 while that of  $CO_3^{2-}$  ion is 1.33. Since the bond length increases as the bond order decreases *i.e.*  $CO < CO_2 < CO_3^{2-}$ . Thus option (d) is correct.
- 15. (b) Dichromate dianion has following structure

$$\begin{bmatrix} O & O \\ \uparrow & \uparrow \\ O \leftarrow Cr - O - Cr \\ \downarrow & O \end{bmatrix}^{2-}$$

6, Cr - O bonds are equivalent.

- 17. (b)  $ClF_3$  is a  $[AB_3]$  type of molecule because it consist of three bonding pair and two lone pair of electrons hence this compound shows  $sp^3d$  hybridization.
- **20.** (a)  $BeF_3^-$  does not show  $sp^3$  -hybridization because this compound is not formed.
- **21.** (a)  $K_3[Fe(CN)_6]$

Unpaired electron  $d^2sp^3$ -hybridization

- **22.** (d)  $N_2^+$  has one unpaired electron so it would be paramagnetic.
- **23.** (a) Each of the species has 14 electron so isoelectronic and shows bond order 3.

B.O. = 
$$\frac{1}{2}[N_b - N_a] = \frac{1}{2}[10 - 4] = \frac{6}{2} = 3$$
.

**24.** (d)

Trimer of  $SO_3$ .

**27.** (c)  $CuSO_4.5H_2O$  has electrovalent, covalent and coordinate bonds.

## **Assertion & Reason**

- **1.** (a) Solubility in water depends on hydration energy and lattice energy.
- 2. (a) Polarity in covalent bond developed due to shifting of electrons towards one of the bonded atoms.
- **5.** (c)  $SiF_4$  have  $sp^3$  hybridization & shape of regular

tetrahedral where the bond angle of F-S-F are found  $109.5^{\circ}$  which is greater than  $90^{\circ}$  but less than  $180^{\circ}$ .

Repulsion sequence are Lp - Lp > Lp - Bp > Bp - Bp so assertion are true but the reason are false.

- 9. (c)  $N_2$  molecule is diamagnetic. The diamagnetic character is due to the presence of paired electron  $N_2$  molecule does not contain any unpaired electron. Thus, assertion is coorect but the reason is false.
- 10. (a) It is correct that during formation of Ice from water there are vacant spaces between hydrogen bonded molecules of Ice. Ice has a cage like structure. Due to this reason Ice is less dense than liquid water. hence both assertion & reason are true & reason are the correct explanation of assertion.
- 11. (b) Water is liquid while  $H_2S$  is gas because oxygen is of small size & more electronegative in comparision to sulphur. Hence water molecules exist as associated molecules to form liquid state due to hydrogen bonding  $H_2S$  does not have hydrogen bonding & can't associated hence it is gas.
- 12. (d) Iodine is more soluble in  $CCl_4$  than in  $H_2O$  because iodine is non polar & thus it dissolve in  $CCl_4$  because like dissolves like.
- 13. (a) o & p-nitrophenols can be separated by steam distillation because o-nitrophenol is steam volatile. Here, both assertion & reason are correct & reason is correct explanation of assertion.

- **14.** (e) Fluorine is highly reactive F-F bond has low bond dissociation energy. Here assertion is false but reason is true.
- **15.** (c) It is true that sigma  $(\sigma)$  bond is stronger than pi  $(\pi)$  bond but the reason that there is free rotation of atoms is false.
- **16.** (c) Energy is released in the formation of the crystal lattice. It is qualitative measure of the stability of an ionic compound so assertion is true & reason are false.
- 17. (c) Li, Na & K are alkali metals & not alkaline earth metal so, size of alkali metal increases So. Assertion is true & reason are false.
- 18. (b) Hess's law states that the enthalpy of a reaction is the same, whether it takes place in a single step or in more than one step. In born haber cycle the formation of an cycle ionic compound may occur either by direct combination of the element or by a stepwise process involving vaporization of elements, conversion of the gaseous atoms into ions & the combination of the gaseous ions to form the ionic solid.
- **19.** (a) With increase in bond order, bond length decreases & hence bond energy increases so both assertion & reason are true & reason are the correct explanation of assertion.
- **20.** (c) Electron affinity is experimentally measurable while electronegativity is a relative number so assertion is true but reason are false.
- 21. (b) Assertion & reason both are correct but reason is not the correct explanation of assertion sulphur has five electrons pairs whose arrangement should be trigonal bipyramidal according to VSEPR theory. Two structure are possible

Lone pair in the Lone pair in the axial position (three equatorial position l.p - b.p repulsion at (two L.p - b.p

**22.** (e)  $BF_3$  has zero dipole moment because of its structure.

$$F \longleftarrow B \xrightarrow{F} \mu = 0$$

 $H_2S$  has two lone pairs on sulphur atom & hence. It has irregular shape.

Thus it possess dipole moment. So assertion is false but reason are true.

- 23. (d) Both assertion & reason are false because pairs of electron will have different spins. Electrons are equally shared between them.
- **24.** (d) In  $B_2$ , total number of electrons = 10  $B_2 \rightarrow \sigma(1s)^2 \ \sigma^*(1s^2) \ \sigma(2s)^2 \ \sigma^*(2s)^2 \ \sigma(2p_x)^1$   $\pi(2p_y)^1$

Presence of unpaired electron shows the paramagnetic nature.

The highest occupied molecular orbital is of  $\pi$ -type.

- 25. (a) Both assertion & reason are true & reason is the correct explanation of the assertion because. At any given instant, at room temperature each water molecules forms hydrogen bonds with other water molecules. The  $H_2O$  molecules are in continuous motion. So hydrogen bonds are constantly & rapidly broken & formed. In Ice  $H_2O$  molecules are however fixed in the space lattice.
- **26.** (a) Both assertion & reason are true & reason is the correct explanation of assertion, because helium molecule is formed by linking two helium atoms. both have 1s orbitals. These will combine to form two molecular orbitals  $\sigma$  (1s) &  $\sigma^*$  (1s) four available electrons are accommodated as  $\sigma(1s)^2$  &  $\sigma^*(1s)^2$ .
