Aldehydes, Ketones and Carboxylic Acids

Nomenclature of aldehydes and ketones -

Aldehydes:

Often called by their common names instead of IUPAC names.

Ketones:

Derived by naming two alkyl or aryl groups bonded to the carbonyl group

Alkyl phenyl ketones are usually named by adding the acyl group as prefix to phenone.

Acetone

Acetophenone

IUPAC Nomenclature

(i) For open-chain aliphatic aldehydes and ketones, IUPAC names are derived from the names of the corresponding alkanes by replacing the ending '-e' with '-al' and '-one' respectively.

(ii) In the case of aldehydes, the longest chain is numbered starting from the carbon of the aldehydic group.

(iii) In the case of ketones, the numbering begins from the end nearer to the carbonyl group.

(iv) Substituents are prefixed in the alphabetical order along with the numerals indicating their positions in the carbon chain.

(v) Same rule is applicable to cyclic ketones.

(vi) If the aldehydic group is attached to a ring, then the suffix carbaldehyde is added to the full name of cyclohexane.

Example:

Structure of the carbonyl group –The carbonyl carbon atom is sp² hybridised and forms three bonds and one π bond.

C=O double bond is polarised due to higher electronegativity of oxygen relative to carbon.

Carbonyl carbon – an electrophile (Lewis acid)

Carbonyl oxygen – a nucleophile (Lewis base)

Preparation of aldehydes and ketones:

(I) By oxidation of alcohols -

- (i) Primary alcohols _____Aldehydes
- (ii) Secondary alcohols ____ Ketones

(II) By dehydrogenation of alcohols

- (i) Primary alcohols _____Aldehydes
- (ii) Secondary alcohols _____ Ketones

Preparation of aldehydes:

(I) From acyl chloride –(Rosenmund reduction)

$$R - C - Cl \xrightarrow{H_2}{Pd - BaSO_4} RCHO$$

Acyl chloride

Aldehyde

(II) From nitriles – (Stephen reaction) $RCN + SnCl_2 + HCl \longrightarrow RCH = NH \xrightarrow{H_3O^+} RCHO$

(III) From esters – Esters $\xrightarrow{1. \text{ DIBAL-H}}$ Aldehydes

(IV) From hydrocarbons -

By oxidation of methylbenzene (toluene) (Etard reaction)

By side-chain chlorination, followed by hydrolysis

Gatterman-Koch reaction

Preparation of ketones:

(I) From acyl chlorides –

$$2R-Mg-X + CdCl_{2} \longrightarrow R_{2}Cd + 2Mg(X)Cl$$

$$2R'-C-Cl + R_{2}Cd \longrightarrow 2R'-C-R + CdCl_{2}$$

$$\| 0$$

$$0$$

(II) From nitriles –

(III) From benzene or substituted benzene – (Friedel–Crafts acylation reaction)

Physical properties of aldehydes and ketones:

Boiling points:

(i) Due to dipole–dipole interactions in aldehydes and ketones, they have higher boiling points than hydrocarbons and ethers of comparable molecular masses.

(ii) Due to the presence of intermolecular H-bonding in alcohols, the boiling points of aldehydes and ketones are higher than those of alcohols of comparable molecular masses.

Solubility: The solubility of aldehydes and ketones in water decreases with increase in the length of the alkyl chain.

Chemical reactions of aldehydes and ketones:

(A) Nucleophilic addition reactions –

Reactivity: Due to steric and electronic reasons, aldehydes are more reactive than ketones towards nucleophilic addition reactions.

(i) Addition of HCN

 $HCN + OH^{-} \longleftrightarrow : \overline{C}N + H_2O$

(ii) Addition of Grignard reagents

(iii) Addition of alcohols

(iv) Addition of ammonia and its derivatives

 $Z = alkyl, aryl, OH, NH_3, C_6H_5NH, NHCONH_2, etc$

(B) Reduction –

(i) Reduction to alcohols

(a) Aldehydes $\xrightarrow{\text{NaBH}_4 \text{ or LiAIH}_4}$ Primary alcohols

(b) Ketones $\xrightarrow{\text{NaBH}_4 \text{ or LiAlH}_4}$ Secondary alcohols

(ii) Reduction to hydrocarbons

(a) Clemmenson reduction

$$c = 0 \frac{Zn - Hg}{HCl} \rightarrow CH_2 + H_2O$$

(b) Wolf–Kishner reduction

 $c = 0 \xrightarrow{NH_2NH_2} c = NNH_2 \xrightarrow{KOH/ethylene glycol} cH_2 + N_2$

(C) Oxidation: Tests to distinguish between aldehydes and ketones –

(i) Tollen's test: Tollen's reagent is Ammoniac silver nitrate solution. Ketones do not respond to this test.

$$R - CHO + 2\left[Ag(NH_3)_2\right]^+ + 3OH^- \longrightarrow RCOO^- + 2Ag + 2H_2O + 4NH_3$$

(ii) Fehling's test: Ketones as well as aromatic aldehydes do not respond to this test.

$$R - CHO + 2Cu^{2+} + 5OH^{-} \longrightarrow RCOO^{-} + Cu_2O + 3H_2O$$

red-brown ppt

(iii) Oxidation by haloform reaction -

Aldehydes and ketones having at least one methyl group linked to the carbonyl carbon atom undergo this reaction.

Reactions due to a-hydrogen -

Aldol condensation (aldol reaction): Aldehydes and ketones having at least one - hydrogen undergo this reaction.

Cross aldol condensation: Aldol condensation between two different aldehydes and/or ketones

If both of them contain -hydrogen, then they give a mixture of four products.

Other reactions -

Cannizzaro reaction: Aldehydes that do not have an -hydrogen atom undergo this reaction.

Electrophilic substitution reaction:

Uses of Aldehydes and Ketones

(i) As solvents.

(ii) As starting materials and reagents for the synthesis of other products.

(iii) Acetaldehyde – In the manufacture of acetic acid, ethyl acetate, vinyl acetate, polymers and drugs.

(iv) Benzaldehyde – In perfumery and in dye industries.

(v) Butyraldehyde, vanillin, camphor, etc., are well known for their odours and flavours.

(vi) Acetone and ethyl methyl ketone - Common industrial solvents.

Nomenclature

In the IUPAC system, aliphatic carboxylic acids are named as follows:

(i) By replacing the ending '– e' in the name of the corresponding alkane with '– oic acid'

(ii) Carboxylic carbon is numbered one.

(iii) If more than one carboxyl groups are present, then the ending '- e' of the alkane is retained.

(iv) The number of carboxyl groups is indicated by adding prefix, *d*, tri, etc. to the term '*oic*'.

For example:

(a) CH₃COOH :

Common name: Acetic acid

IUPAC name: Ethanoic acid

(b) HOOC -(CH₂)₄-COOH:

Common name: Adipic acid

IUPAC name: Hexanedioic acid

Methods of Preparation of Carboxylic Acid

(i) From primary alcohols

$$\begin{array}{c} \operatorname{RCH}_{2}\operatorname{OH} & \xrightarrow{1.\operatorname{Alkaline \ KMnO_{4}}} \operatorname{RCOOH} \\ \operatorname{RCH}_{2}\operatorname{OH} & \xrightarrow{K_{2}\operatorname{Cr}_{2}\operatorname{O_{7}/H^{+}}} \operatorname{RCOOH} \\ \operatorname{CH}_{3}(\operatorname{CH}_{2})_{8}\operatorname{CH}_{2}\operatorname{OH} & \xrightarrow{\operatorname{CrO_{3}-H_{2}SO_{4}}} \operatorname{CH}_{3}(\operatorname{CH}_{2})_{8}\operatorname{COOH} \\ \operatorname{1-Decanol} & \operatorname{Decanoic \ acid} \end{array}$$

(ii) From primary aldehydes

 $RCHO \xrightarrow{[0]} R - COOH$

Oxidising agents – HNO₃, KMnO₄, K₂Cr₂O₇

Mild oxidising agents – Tollen's reagent and Fehling's reagent

(iii) From alkyl benzenes

(iv) From nitriles and amides

(v) From Grignard reagents

(vi) From acyl halides

(vii) From acyl anhydrides

(viii) From esters:

Acidic hydrolysis:

Basic hydrolysis:

CH₃CH₂CH₂COOC₂H₅ $\xrightarrow{\text{NaOH}}$ CH₃CH₂CH₂COONa + C₂H₅OH Ethyl butanoate H_3O^+ CH₃CH₂CH₂COOH Butanoic acid

Chemical reactions:

(I) Reactions that involve cleavage of O-H bond: Acidity

(a) Reactions with metals and alkalies

 $2R - COOH + 2Na \longrightarrow 2RCOONa + H_2$ Sodium carboxylate $R - COOH + NaOH \longrightarrow R - COONa + H_2O$ $R - COOH + NaHCO_3 \longrightarrow RCOONa + H_2O + CO_2$

(b) Carboxylic acids are more acidic than phenols because the carboxylate ion is more stable than phenoxide ion.

(c) Electron-withdrawing groups increase the acidity of carboxylic acid while electron-donating groups decrease the acidity.

(II) Reactions that involve cleavage of C-OH bond

(a) Formation of anhydride

Ethanoic acid

Ethanoic anhvdride

(b) Esterification: Catalyst Conc. H₂SO₄ or HCl gas

 $RCOOH + R'OH \xleftarrow{H^+} RCOOR' + H_2O$ Acid Alcohol Ester Water

(c) Reactions with PCl₅, PCl₃, and SOCl₂

 $RCOOH + PCl_{5} \longrightarrow RCOCl + PCl_{3} + HCl$ $3RCOOH + PCl_{3} \longrightarrow 3RCOCl + H_{3}PO_{3}$ $RCOOH + SOCl_{2} \longrightarrow RCOCl + SO_{2} + HCl$

(d) Reaction with ammonia

(iii) Reactions that involve -COOH group

(a) Reduction

$$R - COOH \xrightarrow{(i)LiAlH_4/Ether \text{ or } B_2H_6} R - CH_2 - OH$$
(Alcohol)
(Alcohol)

(b) De-carboxylation

$$R - COONa \xrightarrow{NaOH-CaO} R - H + Na_2CO_3$$
(Alkane)

(c) Substitution reactions in the hydrocarbon part

(d) Halogenations

(i) Hell–Volhard–Zelinsky reaction

$$R-CH_2-COOH \xrightarrow{(i) X_2/Phosphorus} R-CH-COOH$$

$$\downarrow X$$

$$X = Cl, Br$$

α-Halocarboxylic acid

Carboxylic acids having an -hydrogen undergo this reaction.

(ii) Ring substitution

m-Bromobenzoic acid

Uses of Carboxylic Acids

- (i) Methanoic acid In rubber, textile, dyeing, leather and electroplating industries
- (ii) Ethanolic acid As a solvent and as a vinegar in food industry
- (iii) Hexanoic acid In the manufacture of nylon-6, 6
- (iv) Higher fatty acids For the manufacture of soaps and detergents

- (v) Esters of benzoic acid In perfumery
- (vi) Sodium benzoate As a food preservative
