	Eliminating t between the equations, we obtain the equation of the	
	path $\frac{x}{2} = \frac{y}{-4} = \frac{z}{4}$ , which are the equations of the line passing

	(iii) $A = 2x \times 2 \frac{b}{a} \sqrt{a^2 - x^2}, x \in (0, a).$	
	Squaring both sides, we get	
	$Z = A^{2} = \frac{16b^{2}}{a^{2}}x^{2}(a^{2} - x^{2}) = \frac{16b^{2}}{a^{2}}(x^{2}a^{2} - x^{4}), x \in (0, a).$	
	A is maximum when Z is maximum.	
	$\frac{dZ}{dx} = \frac{16b^2}{a^2} (2xa^2 - 4x^3) = \frac{32b^2}{a^2} x (a + \sqrt{2}x)(a - \sqrt{2}x)$	
	$\frac{dx}{dx} = \frac{1}{a^2} (2xa^2 - 4x^2) = \frac{1}{a^2} x(a + \sqrt{2x})(a - \sqrt{2x})$	
	$\frac{dZ}{dx} = 0 \Rightarrow x = \frac{a}{\sqrt{2}}.$	
	$\frac{d^2 Z}{dx^2} = \frac{32b^2}{a^2} (a^2 - 6x^2)$	
	$\left(\frac{d^2 Z}{dx^2}\right)_{x=\frac{a}{\sqrt{2}}} = \frac{32b^2}{a^2}(a^2 - 3a^2) = -64b^2 < 0$	
		1
	Hence, by the second derivative test, there is a local maximum value of Z at the $a^{a}$	
	critical point $x = \frac{a}{\sqrt{2}}$ . Since there is only one critical point, therefore, Z is	1/2
	maximum at $x = \frac{a}{\sqrt{2}}$ , hence, A is maximum at $x = \frac{a}{\sqrt{2}}$ .	
	Thus, for maximum area of the soccer field, its length should be $a\sqrt{2}$ and its width	
	should be $b\sqrt{2}$ .	1/2
38.	(i)Let P be the event that the shell fired from A hits the plane and Q be the event	
	that the shell fired from B hits the plane. The following four hypotheses are	
	possible before the trial, with the guns operating independently: $E_1 = PQ, E_2 = \overline{P}\overline{Q}, E_3 = \overline{P}Q, E_4 = P\overline{Q}$	
	Let $E =$ The shell fired from exactly one of them hits the plane.	
	$P(E_1) = 0.3 \times 0.2 = 0.06, P(E_2) = 0.7 \times 0.8 = 0.56, P(E_3) = 0.7 \times 0.2$	
	$= 0.14, P(E_4) = 0.3 \times 0.8 = 0.24$	
	$P\left(\frac{E}{E_1}\right) = 0, P\left(\frac{E}{E_2}\right) = 0, P\left(\frac{E}{E_3}\right) = 1, P\left(\frac{E}{E_4}\right) = 1$	1
	$P(E) = P(E_1) \cdot P\left(\frac{E}{E_1}\right) + P(E_2) \cdot P\left(\frac{E}{E_2}\right) + P(E_3) \cdot P\left(\frac{E}{E_2}\right) + P(E_4) \cdot P\left(\frac{E}{E_4}\right)$	
	= 0.14 + 0.24 = 0.38	1
	$P(E_0) P(\frac{E}{E_0})$	
	(ii)By Bayes' Theorem, $P\left(\frac{E_3}{E}\right) = \frac{P(E_3).P\left(\frac{E}{E_3}\right)}{P(E_1).P\left(\frac{E}{E_1}\right) + P(E_2).P\left(\frac{E}{E_2}\right) + P(E_3).P\left(\frac{E}{E_3}\right) + P(E_4).P\left(\frac{E}{E_4}\right)}$

	NOTE. The four hypertheses forms the martition of the second second it.	
	NOTE: The four hypotheses form the partition of the sample space and it can be seen that the sum of their probabilities is 1. The hypotheses $E_1$ and $E_2$ are actually	
	eliminated as $P\left(\frac{E}{E_1}\right) = P\left(\frac{E}{E_2}\right) = 0$
