Optical instruments **105** (IV) Myopia (D) Convex spectacle lens of suitable focal length (a) I-A; II-C; III-B; IV-D (b) I-B; II-D; III-C; IV-A (c) I-D; II-B; III-A; IV-C (d) I-D; II-A; III-C; IV-B 23. The human eye has a lens which has a [MP PET 1994] (a) Soft portion at its centre (b) Hard surface (d) Constant refractive index (c) Varying refractive index A man with defective eyes cannot see distinctly object at the distance more than 60 cm from his eyes. The 24. power of the lens to be used will be [MP PMT 1994]  $\frac{1}{D}$ (d)  $\frac{1}{1.66}$ (a) + 60D(b) -60D(c) - 1.66D A person's near point is 50 cm and his far point is 3 m. Power of the lenses he requires for 25. (i) Reading and (ii) For seeing distant stars are [MP PMT 1994] (a) -2D and 0.33D(b) 2D and - 0.33D (c) -2D and 3D(d) 2D and - 3D The focal length of a simple convex lens used as a magnifier is 10 cm. For the image to be formed at a 26. distance of distinct vision (D = 25 cm), the object must be placed away from the lens at a distance of [CPMT 1991] (b) 7.14 cm (c) 7.20 cm (d) 16.16 cm (a) 5 cm A person is suffering from myopic defect. He is able to see clear objects placed at 15 cm. What type and of what 27. focal length of lens he should use to see clearly the object placed 60 *cm* away [MP PMT 1991] (a) Concave lens of 20 *cm* focal length (b) Convex lens of 20 cm focal length (c) Concave lens of 12 *cm* focal length (d) Convex lens of 12 cm focal length A person can see a thing clearly when it is at a distance of 1 *metre* only. If he wishes to see a distance star, he 28. needs a lens of focal length [MP PET 1990] (a) +100 cm (b) - 100 cm (c) +50 cm (d)  $-50 \, cm$ A man suffering from myopia can read a book placed at 10 *cm* distance. For reading the book at a distance of 60 29. cm with relaxed vision, focal length of the lens required will be [MP PMT 1989] (a) 45 cm (b) - 20 cm (c) -12 cm (d) 30 cm A person can see clearly objects at 100 cm distance. If he wants to see objects at 40 cm distance, then the power 30. of the lens he shall require is [MP PET 1989] (a) +1.5 D (c) +3.0 D (b) - 1.5 D (d) -3.0 D 31. If the distance of the far point for a myopia patient is doubled, the focal length of the lens required to cure it will become [MP PET 1989] (b) Double (a) Half (c) The same but a convex lens (d) The same but a concave lens Image is formed for the short sighted person at 32. [AFMC 1988] (a) Retina (b) Before retina (c) Behind the retina (d) Image is not formed at all A man who cannot see clearly beyond 5 *m* wants to see stars clearly. He should use a lens of focal length 33. [MP PET/PMT 1988] (a) - 100 metre (b) + 5 metre (c) - 5 metre (d) Very large Far point of myopic eye is 250 *cm*, then the focal length of the lens to be used will be [CPMT 1986; DPMT 2002] 34. (a) + 250 cm (b) - 250 cm (c)  $+ 250/9 \, cm$ (d) - 250/9 cm One can take pictures of objects which are completely invisible to the eye using camera film which are invisible 35. [MNR 1985] to (a) Ultra-violet rays (b) Sodium light (c) Visible light (d) Infra-red rays In human eye the focussing is done by [CPMT 1983] 36.

Optical instruments 113 (b) The angular magnification of the planet is 800 (c) The image of the planet is inverted (d) All of the above 119. The astronomical telescope consists of objective and eye-piece. The focal length of the objective is[AIIMS 1998; BHU 20 (a) Equal to that of the eye-piece (b) Greater than that of the eye-piece (c) Shorter than that of the eye-piece (d) Five times shorter than that of the eve-piece **120.** The diameter of the objective of a telescope is a, the magnifying power is m and wavelength of light is  $\lambda$ . The resolving power of the telescope is [MP PMT 2000] (a)  $(1.22\lambda)/a$ (b)  $(1.22a)/\lambda$ (c)  $\lambda m/(1.22a)$ (d)  $a/(1.22\lambda m)$ **121.** An astronomical telescope has an angular magnification of magnitude 5 for distant objects. The separation between the objective and the eyepiece is 36 cm and final image is formed at infinity. The focal lengths of the objective and eyepiece are respectively [IIT-JEE 1989; MP PET 1995; JIPMER 2000] (a) 20 cm, 16 cm (b) 50 cm, 10 cm (c) 30 cm, 6 cm (d) 45 cm, -9 cm 122. A photograph of the moon was taken with telescope. Later on, it was found that a housefly was sitting on the objective lens of the telescope. In photograph [NCERT 1970; MP PET 1999] (a) The image of housefly will be reduced (b) There is a reduction in the intensity of the image (c) There is an increase in the intensity of the image (d) The image of the housefly will be enlarged **123.** The magnifying power of a telescope is *M*. If the focal length of eye piece is doubled, then the magnifying power will become [Haryana CEET 1998] (c)  $\sqrt{2M}$ (a) 2 M (b) M/2(d) 3 M**124.** The minimum magnifying power of a telescope is *M*. If the focal length of its eyelens is halved, the magnifying power will become [MP PMT/PET 1998] (a) M/2(b) 2 *M* (d) 4 M (c) 3 M **125.** The final image in an astronomical telescope is [EAMCET (Engg.) 1998] (a) Real and errect (b) Virtual and inverted (c) Real and inverted (d) Virtual and errect 126. The astronomical telescope has two lenses of focal powers 0.5 D and 20 D. Its magnifying power will be [CPMT 1997] (a) 40 (b) 10 (c) 100 (d) 35 127. An astronomical telescope of ten-fold angular magnification has a length of 44 cm. The focal length of the objective is [CBSE PMT 1997] (a) 4 cm (b) 40 cm (c) 44 cm (d) 440 cm 128. A telescope consisting of an objective of focal length 100 cm and a single eyes lens of focal length 10 cm is focussed on a distant object in such a way that parallel rays emerge from the eye lens. If the object subtends an angle of 2° at the objective, the angular width of the image is [JIPMER 1997] (a) 20° (b) 1/6° (c) 10° (d) 24° **129.** When diameter of the aperture of the objective of an astronomical telescope is increased, its [MP PMT 1997] (a) Magnifying power is increased and resolving power is decreased (b) Magnifying power and resolving power both are increased (c) Magnifying power remains the same but resolving power is increased (d) Magnifying power and resolving power both are decreased

To increase the magnifying power of telescope ( $f_o$  = focal length of the objective and  $f_e$  = focal length of the eye 141. lens) [MP PET/PMT 1988; MP PMT 1992, 94] (a)  $f_o$  should be large and  $f_e$  should be small (b)  $f_o$  should be small and  $f_e$  should be large (c)  $f_o$  and  $f_e$  both should be large (d)  $f_o$  and  $f_e$  both should be small **142.** The limit of resolution of a 100 cm telescope ( $\lambda = 5.5 \times 10^{-7}$  m) is [BHU 1993] (a) 0.14" (b) 0.3" (c) 1' (d) 1" 143. In a reflecting astronomical telescope, if the objective (a spherical mirror) is replaced by a parabolic mirror of the same focal length and aperture, then [IIT-JEE 1993] (a) The final image will be erect (b) The larger image will be obtained (c) The telescope will gather more light (d) Spherical aberration will be absent **144.** A planet is observed by an astronomical refracting telescope having an objective of focal length 16 m and an eyepiece of focal length 2 cm [IIT-JEE 1993] (a) The distance between the objective and the eyepiece is 16.02 m(b) The angular magnification of the planet is 800 (c) The image of the planet is inverted (d) The objective is larger than the eyepiece 145. The average distance between the earth and moon is  $38.6 \times 10^4$  km. The minimum separation between the two points on the surface of the moon that can be resolved by a telescope whose objective lens has a diameter of 5 *m* with  $\lambda = 6000 \text{ Å}$  is [MP PMT 1993] (a) 5.65 m (b) 28.25 m (c) 11.30 m (d) 56.51 m 146. The focal length of the objective and eye piece of a telescope are respectively 60 cm and 10 cm. The magnitude of the magnifying power when the image is formed at infinity is [MP PET 1991] (a) 50 (b) 6(c) 70 (d) 5 147. The focal length of an objective of a telescope is 3 metre and diameter 15 cm. Assuming for a normal eye, the diameter of the pupil is 3 mm for its complete use, the focal length of eye piece must be [MP PET 1989] (a) 6 cm (b) 6.3 cm (c) 20 cm (d) 60 cm 148. An opera glass (Gallilean telescope) measures 9 cm from the objective to the eyepiece. The focal length of the objective is 15 cm. Its magnifying power is [DPMT 1988] (a) 2.5 (d) 0.4 (b) 2/5 (c) 5/3 149. The focal length of objective and eye lens of a astronomical telescope are respectively 2 m and 5 cm. Final image is formed at (i) least distance of distinct vision (ii) infinity. The magnifying power in both cases will be [MP PM (b) - 40, - 48 (c) - 40, 48 (d) - 48, 40 (a) - 48, - 40 150. An optical device that enables an observer to see over or around opaque objects, is called [CPMT 1986] (a) Microscope (b) Telescope (c) Periscope (d) Hydrometer **151.** The magnifying power of a telescope can be increased by [CPMT 1979] (a) Increasing focal length of the system (b) Fitting eye piece of high power (c) Fitting eye piece of low power (d) Increasing the distance of objects **152.** An achromatic telescope objective is to be made by combining the lenses of flint and crown glasses. This proper choice is [CPMT 1977] (a) Convergent of crown and divergent of flint (b) Divergent of crown and convergent of flint (c) Both divergent (d) Both convergent

Optical instruments 115

**153.** An observer looks at a tree of height 15 *m* with a telescope of magnifying power 10. To him, the tree appears **[CPMT 19**

(a) 5 mm (b) 1 mm (c) 0.5 mm (d) 0.1 mm

- **166.** The objective of a telescope, after focussing for infinity is taken out and a slit of length *L* is placed in its position. A sharp image of the slit is formed by the eye-piece at a certain distance from it on the other side. The length of this image is *l*, then magnification of telescope is
  - (a)  $\frac{l}{2L}$  (b)  $\frac{2L}{l}$  (c)  $\frac{l}{L}$  (d)  $\frac{L}{l}$
- **167.** An astronomical telescope in normal adjustment receives light from a distant source *S*. The tube length is now decreased slightly
  - (a) A virtual image of S will be formed at a finite distance
  - (b) No image will be formed
  - (c) A small, real image of S will be formed behind the eye-piece, close to it
  - (d) A large, real image of S will be formed behind the eye-piece, far away from it
- **168.** A telescope consisting of object glass of power + 2 D and eye-glass of power + 20 D is focussed on an object 1m from the object glass. The final image is seen with completely relaxed eye. The magnifying power of the telescope is
  - (a) 20 (b) 41 (c) 24 (d) 49.2
- 169. An astronomical telescope and a Galilean telescope use identical objective lenses. They have the same magnification, when both are in normal adjustment. The eye-piece of the astronomical telescope has a focal length f
  - (a) The tube lengths of the two telescopes differ by f
- (b) The tube lengths of the two telescopes differ by 2f
- (c) The Galilean telescope has a shorter tube length
- (d) The Galilean telescope has a longer tube length
