

Components of Food

Keywords : Nutrient, Jaggery, Vitamins, Thepla, Obesity, Balanced Diet

In Chapter 1, we made lists of the food items that we eat. We also identified food items eaten in different parts of India and marked these on its map.

A meal could consist of chapati, dal and brinjal curry. Another may be rice, sambar and a vegetable preparation of ladyfinger (bhindi). Yet another meal could be fish curry and vegetables.

Activity 1

Our meals usually have at least one item made of some kind of grain.

Other items could be a dal or a dish of meat or vegetable. It may also include items like curd, butter milk and pickles. Some examples of meals from different regions are given in Table 2.1. Select food items you depicted on the map in Chapter 1. Add some more meals to this list and enter these in Table 2.1.

Region/State	Item of grain	Item of dal/meat	Vegetables	Others
Jammu	Wheat (roti)	Rajma and Moong	Mooli	Ghee
Kashmir	Rice	Rajma, Chicken	Knol Khol, Potato, tomato	oil
Ladakh	Rice	Rajma	Lada Khi Saag, Radish	_
Punjab	Makki (corn) roti	Rajma(Kidney beans)	Sarsoon Saag	Curd, ghee

Table 2.1 Some common meals of different regions/States

Sometimes, we may not really have all this variety in our meals. If we are travelling, we may eat whatever is available on the way. It may not be possible for some of us, to eat such a variety of items, most of the time.

There must be some reason though, why meals usually consist of such a distribution. Do you think that our body needs different kinds of food for some special purpose?

2.1 WHAT DO DIFFERENT FOOD ITEMS CONTAIN?

We know that each dish is usually made up of one or more ingredients, which we get from plants or animals. These ingredients contain some components that are needed by our body. These components are called nutrients. The major nutrients in our food are called carbohydrates, proteins, fats, vitamins and minerals. In addition, food contains dietary fibres and water which are also needed by our body.

Do all food contain all these nutrients? With some simple methods we can test whether

cooked food or a raw ingredient contains one or more of these nutrients. The tests for presence of carbohydrates, proteins and fats are simpler to do as compared to the tests for other nutrients. Let us do these tests and record all our observations in Table 2.2.

For carrying out these tests, you will need solutions of iodine, copper sulphate and caustic soda. You will also need a few test tubes and a dropper.

Try these tests on cooked food items as well as raw materials. Table 2.2 shows you a way to record the observations from these tests. Some food items are given in this table. You can conduct the tests either with these or any other available food items. Do these tests carefully and do not try to eat or taste any chemicals.

If the required solutions are not available in readymade form, your teacher can prepare them as follows.

Let us begin by testing different food items to see if they contain carbohydrates. There are many types of carbohydrates. The main carbohydrates found in our food are in the form of starch and sugars. We can easily test if a food item contains starch.

Activity 2

Test for Starch

Take a small quantity of a food item or a raw ingredient. Put 2-3 drops of dilute iodine solution on it (Fig. 2.1). Observe if there is any change in the colour of the food item. Did it turn blue-black? A blue-black colour indicates that it contains starch.

Repeat this test with other food items to find out which of these contain starch. Enter all your observations in Table 2.2.

Fig 2.1 Testing for starch

- A dilute solution of iodine can be prepared by adding a few drops of tincture iodine to a test tube half filled with water.
- Copper sulphate solution can be prepared by dissolving 2 gram (g) of copper sulphate in 100 millilitre(ml) of water
- 10 g of caustic soda dissolved in 100 mL of water makes the required solution of caustic soda..

Test for Protein

Take a small quantity of a food item for testing. If the food you want to test is a solid, you first need to make a paste of it or powder it. Grind or mash a small quantity of the food item. Put some of this in a clean test tube, add 10 drops of water to it and shake the test tube.

Fig 2.2 Testing for protein

Now, using a dropper, add two drops of solution of copper sulphate and ten drops of solution of caustic soda to the test tube (Fig. 2.2). Shake well and <u>let</u> the test tube stand for <u>a</u> few minutes. What do you see? Did the contents of the test tube turn violet? A violet colour indicates presence of proteins in the food item.

Now, you can repeat this test on other food items.

Do You Know?

The nails on your fingers and toes and the hair on your head are pure proteins.

Food item	Starch (present)	Protein (present)	Fat (present)
Raw Potato	yes		
Milk		yes	
Groundnut			yes
Un cooked powdered rice			
Cooked rice			
Cooked dal			
A slice of any vegetable			
A Slice of any fruit			
Boiled egg (white portion)			

Table 2.2 Nutrients present in some food items

Test for Fats

Take a small quantity of a food item. Wrap it in a piece of paper and crush it. Take care that the paper does not tear. Now, straighten the paper and observe it carefully. Does it have an oily spot patch? Hold the paper against light. Are you able to see the light faintly, through this patch?

An oily patch on paper shows that the food item contains fat. The food items may sometimes contain a little water. Therefore, after you have rubbed an item on paper, let the paper dry for a while. If there were any water that may have come from food, it would dry up after some time. If no oily patch shows up after this, the food item does not contain any fat.

What do these tests show? Are fats, proteins and starch present in all the food items that you tested? Does a food item contain more than one nutrient? Do you find any food item that does not contain any of these nutrients?

We tested food items for three nutrients — carbohydrates, proteins and fats. There are also other nutrients like vitamins and minerals that are present in different food items. Why do we need all these nutrients?

2.2 WHAT DO VARIOUS NUTRIENTS DO FOR OUR BODY?

Carbohydrates mainly provide energy to our body. Fats also give us energy. In fact, fats give much more energy as compared to the same amount of carbohydrates. Foods containing fats and carbohydrates are also called 'energy giving foods' (Fig. 2.3 and Fig. 2.4).

Proteins are needed for the growth and repair of our body. Foods containing proteins are often called 'body building foods' (Fig 2.5).

Vitamins help in protecting our body against diseases. Vitamins also help in keeping our eyes, bones, teeth and gums healthy.

Fig 2.5 Some Sources of proteins (a) Plant sources (b) Animal sources

Vitamins are of different kinds known by different names. Some of these are Vitamin A, Vitamin C, Vitamin D, Vitamin E and K. There is also a group of vitamins called Vitamin B-complex. Our body needs all types of vitamins in small quantities. Vitamin A keeps our skin and eyes healthy. Vitamin C helps body to fight against many diseases. Vitamin D helps our body to use calcium for bones and teeth. Foods that are rich in different vitamins are shown in Fig. 2.6 to Fig. 2.9.

Fig 2.6 Some sources of Vitamin A

Fig 2.7 Some sources of Vitamin B

Fig 2.8 Some sources of Vitamin C

Minerals are needed by our body in small amounts. Each one is essential for proper growth

of body and to maintain good health. Some sources of different minerals are shown in Fig. 2.10.

Most food items, usually, have more than one nutrient. You may have noticed this, while recording your observations in Table 2.2. However, in a given raw material, one particular nutrient may be present in much larger quantity than <u>in</u> others. For example, rice has more carbohydrates than other nutrients. Thus, we say that rice is a "carbohydrate rich" source of food.

Fig 2.9 Some sources of Vitamin D

Besides these nutrients, our body needs dietary fibres and water. Dietary fibres are also known as roughage. Roughage is mainly provided by plant products in our foods. Whole grains and pulses, potatoes, fresh fruits and vegetables are main sources of roughage. Roughage does not provide any nutrient to our body, but is an essential component of our food and adds to its bulk. This helps our body to get rid of undigested food.

Water helps our body to absorb nutrients from food. It also helps in throwing out some wastes from body as urine and sweat. Normally, we get most of the water that our body needs

Some sources of iodine, Iodine Source

Some sources of Phosphorus, P. Source

Some sources of Calcium, Calcium Source

from the liquids we drink — such as water, milk and tea. In addition, we add water to most cooked foods. Let's see if there is any other source which provides water to our body.

S Activity 3 *€*

Take a tomato or a fruit like lemon. Cut it into small pieces. Do your hands get wet while doing so?

Carefully observe whenever vegetables and fruits are being cut, peeled, grated or meshed at your home. Do you find any fresh vegetables or fruits that do not contain some amount of water?

We see that many food materials themselves contain water. To some extent, our body needs are met by this water. Apart from this, we also add water while cooking many food items.

2.3 BALANCED DIET

The food we normally eat in a day is our diet. For growth and maintenance of good health,

our diet should have all the nutrients that our body needs, in right quantities. Not too much of one and not too little of the other. The diet should also contain a good amount of roughage and water. Such a diet is called a balanced diet.

Do you think that people of all ages need the same type of diet? Do you also think that, what we need for a balanced diet would depend on the amount of physical work that we do?

Prepare a chart of whatever you eat over a period of a week. Check whether all the nutrients mentioned are present in one or the other food items being eaten within a day or so.

Pulses, groundnut, soyabean, sprouted seeds (moong and Bengal gram), fermented foods (South Indian foods such as idlis), a combination of flours (missi roti, thepla made from cereals and pulses), banana, spinach, sattu, jaggery, available vegetables and other such foods provide many nutrients. Therefore, one can eat a balanced diet without using expensive food materials.

Eating the right kind of food is not enough. It should also be cooked properly so that its nutrients are not lost. Are you aware that some nutrients get lost in the process of cooking and preparations?

If the vegetables and fruits are washed after cutting or peeling them, it may result in the loss of some vitamins. The peel of many vegetables and fruits contain vitamins and minerals. Similarly, repeated washing of rice and pulses may remove some vitamins and minerals present in them e.g. too much washing of tomato can lead to loss of vitamin C, as vitamin C is water soluble and gets disolved easily.

We all know that cooking improves the taste of food and makes it easier to digest. At the same time, cooking also results in the loss of certain nutrients. Many useful proteins and considerable amount of minerals are lost if excess water is used during cooking and is then thrown away.

Vitamin C gets easily destroyed by heat during cooking. Would it not be sensible to include some fruits and raw vegetables in our diet?

A man thought that fats would be the best foods to eat, all the time. A katori of fat will give much more energy than a katori of carbohydrate rich food, isn't it? So, The man ate nothing but food rich in fats — fried food like samosa and poori, malai, rabdi and peda.

Do you think he was right? No, of course not! It can be very harmful for us to eat too much of fat rich foods and we may end up suffering from a condition called obesity.

2.4 DEFICIENCY DISEASES

A person may be getting enough food to eat, but sometimes the food may not contain a particular nutrient. If this continues over a long period of time, the person may suffer from its deficiency. Deficiency of one or more nutrients can cause diseases or disorders in our body. Diseases that occur due to lack of nutrients over a long period are called **deficiency diseases**.

If a person does not get enough proteins in his/her food for a long time, he/she is likely to have stunted growth, swelling of face, discolouration of hair, skin diseases and diarrhoea.

If the diet is deficient in both carbohydrates and proteins for a long period of time, the growth may stop completely. Such a person becomes very lean and thin and so weak that he/she may not even be able to move or stand.

Deficiency of different vitamins and minerals may also result in certain diseases or disorders. Some of these are mentioned in Table 2.3.

Vitamin/Mineral	Deficiency disease/disorder	Symptoms
Vitamin A	Loss of vision	Poor vision, loss of vision in darkness (night), sometimes complete loss of vision
Vitamin B1	Beri-beri	Weak muscles and very little energy to work
Vitamin C	Scurvy	Bleedingofgums, woundstake longer time to heal
Vitamin D	Rickets	Bones become soft and bent
Calcium	Bone and tooth decay	Weak bones, tooth decay
Iodine	Goiter	Glands in the neck appear swollen, mental disability in children
Iron	Anaemia	Weakness

Table 2.3 Some diseases/disorders caused by deficiency of vitamins and Minerals.

All deficiency diseases can be prevented by taking a balanced diet.

In this chapter, we asked ourselves the reason why widely varying food from different regions had a common distribution. This distribution, we find, ensures that our meals have a balance of the different nutrients needed by the body.

LOOK OUT: Much of the food we eat is processed food. Polished rice and wheat flour (maida) are the examples of "processed foods".

Processing removes many of the B vitamins. Besides beri-beri is caused by lack of Vitamin B₁, we should therefore avoid foods which are processed or polished.

What You have Learnt

The major nutrients in our food are carbohydrates, proteins, fats, vitamins and minerals. In addition, food also contains dietary fibres and water.

- Carbohydrates and fats mainly provide energy to our body.
- Proteins and minerals are needed for the growth and the maintenance of our body.
- Vitamins help in protecting our body against diseases.
- Balanced diet provides all the nutrients that our body needs, in right quantities, along with adequate amount of roughage and water.

• Deficiency of one or more nutrients in our food for a long time may cause certain diseases or disorders.

Exercises

- 1. Name the major nutrients in our food.
- 2. Why should we include vitamins in our diet?
- 3. What is the aim of Mid-Day Meal Programme?
- 4. Name the following:
 - a. The nutrients which mainly give energy to our body.
 - b. The nutrients that are needed for the growth and maintenance of our body.
 - c. A vitamin required for maintaining good eyesight.
 - d. A mineral that is required for keeping our bones healthy.
- 5. Name two foods each rich in:
 - a. Fats
 - b. Starch
 - c. Dietary fibre
 - d. Protein
- 6. Tick (\checkmark) the statements that are correct.
 - a. By eating rice alone, we can fulfill nutritional requirement of our body. ()
 - b. Deficiency diseases can be prevented by eating a balanced diet. ()
 - c. Balanced diet for the body should contain a variety of food items. ()
 - d. Meat alone is sufficient to provide all nutrients to the body. ()
- 7. Fill in the blanks.
 - a. _____ is caused by deficiency of Vitamin D.
 - b. Deficiency of ______ causes a disease known as beri-beri.
 - c. Deficiency of Vitamin C causes a disease known as _____.
 - d. Night blindness is caused due to deficiency of _____ in our food.

- e. Proteins of animal origin are _____, ____and _____
- f. Roughage helps in proper functioning of the _____.
- g. Deficiency of Iodine leads to _____.

SUGGESTED PROJECTS AND ACTIVITIES

- 1. Prepare a diet chart to provide balanced diet to a twelve year old child. The diet chart should include food items which are not expensive and are commonly available in your area.
- 2. We have learnt that excess intake of fats is harmful for the body. What about other nutrients? Would it be harmful for the body to take too much of proteins or vitamins in the diet? Read about diet related problems to find answers to these questions and have a class discussion on this topic.
- 3. Test the food usually eaten by cattle or a pet to find out which nutrients are present in animal food. Compare results obtained from the whole class to conclude about balanced diet requirements for different animals.
