

# Introduction to Three Dimensional Geometry

- **Three-dimensions coordinate planes**

- The coordinate axes of a rectangular Cartesian coordinate system are three mutually perpendicular lines. The axes are called  $x$ ,  $y$ , and  $z$ -axes.
- The three planes determined by the pair of axes are the coordinate planes, called  $XY$ ,  $YZ$  and  $ZX$ -planes.
- The three coordinate planes divide the space into eight parts known as octants.
- In three-dimensional geometry, the coordinates of a point  $P$  are always written in the form of triplets i.e.,  $(x, y, z)$ . Here,  $x$ ,  $y$ , and  $z$  are the distances from the  $YZ$ ,  $ZX$  and  $XY$ -planes. Also, the coordinates of the origin are  $(0, 0, 0)$ .

- The sign of the coordinates of a point determine the octant in which the point lies. The following table shows the signs of the coordinates in the eight octants.

<b>Octants →</b>	<b>I</b>	<b>II</b>	<b>III</b>	<b>IV</b>	<b>V</b>	<b>VI</b>	<b>VII</b>	<b>VIII</b>
<b>Coordinates ↓</b>	+	−	−	+	+	−	−	+
$y$	+	+	−	−	+	+	−	−
$z$	+	+	+	+	−	−	−	−

**Example:** The point  $(-5, 6, -7)$  lies in the VI octant.

- In Coordinates of points lying on different axes:
  - Any point on the  $x$ -axis is of the form  $(x, 0, 0)$
  - Any point on the  $y$ -axis is of the form  $(0, y, 0)$
  - Any point on the  $z$ -axis is of the form  $(0, 0, z)$

- Coordinates of points lying in different planes:
  - Coordinates of a point in the YZ-plane are of the form  $(0, y, z)$
  - Coordinates of a point in the XY-plane are of the form  $(x, y, 0)$
  - Coordinates of a point in the ZX-plane are of the form  $(x, 0, z)$

**Example:** The points  $(-5, 6, 0)$ ,  $(0, -5, 6)$ ,  $(-5, 0, 6)$  lies in the XY-plane, YZ-plane and ZX-plane respectively.

- **distance formula**

Distance between two points  $P(x_1, y_1, z_1)$  and  $Q(x_2, y_2, z_2)$  is given by

$$PQ = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

**Example:** Find the point(s), lying on the  $z$ -axis, whose distance from point  $(2, -1, 3)$  is 3 units.

**Solution:** Let the required point be  $(0, 0, z)$ .

We know that the distance between two points  $(x_1, y_1, z_1)$  and  $(x_2, y_2, z_2)$  is given by  $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$ .

Therefore,

$$\sqrt{(2 - 0)^2 + (-1 - 0)^2 + (3 - z)^2} = 3$$

On squaring both the sides, we get

$$4 + 1 + 9 + z^2 - 6z = 9$$

$$\Rightarrow z^2 - 6z + 5 = 0$$

$$\Rightarrow z^2 - 5z - z + 5 = 0$$

$$\Rightarrow z(z - 5) - 1(z - 5) = 0$$

$$\Rightarrow z = 1, 5$$

Thus, the required points on the  $z$ -axis are  $(0, 0, 1)$  and  $(0, 0, 5)$ .
