According to problem  $F_{up} = 2F_{dn}$ 

 $\Rightarrow mg(\sin\theta + \mu\cos\theta) = 2mg(\sin\theta - \mu\cos\theta)$

#### **Critical Thinking Questions**

### 1. (a) By drawing the free body diagram of the block for critical condition

condition
$$F = \mu R \Rightarrow P + Q \sin \theta$$

$$= \mu (mg + Q \cos \theta)$$

$$\therefore \mu = \frac{P + Q \sin \theta}{mg + Q \cos \theta}$$

$$mg + Q \cos \theta$$

**2.** (c)

$$F_1 = \mu_s R = 0.5 \times (5) = 2.5 N$$

Since downward force is less than limiting friction therefore block is at rest so the static force of friction will work on it.

 $F_s$  = downward force = Weight

$$=0.1\times9.8=0.98 N$$

$$F = \sqrt{f^2 + R^2} = \sqrt{(\mu R)^2 + R^2} = R\sqrt{\mu^2 + 1}$$

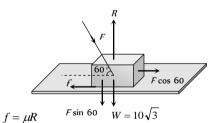

Minimum force = R when there is no friction

Hence ranging from R to  $R\sqrt{\mu^2 + 1}$ 

We get, 
$$Mg \le F \le Mg\sqrt{\mu^2 + 1}$$

**5.** (a)

7.

$$F\cos 60^{\circ} = \mu(W + F\sin 60^{\circ})$$

Substituting 
$$\mu = \frac{1}{2\sqrt{3}}$$
 &  $W = 10\sqrt{3}$  we get  $F = 20N$ 

**6.** (b) When two blocks performs simple harmonic motion together then at the extreme position ( at amplitude =*A*)

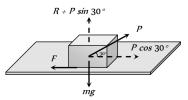

Restoring force 
$$F = KA = 2ma \implies a = \frac{KA}{2m}$$

There will be no relative motion between P and Q if pseudo force on block P is less than or just equal to limiting friction between P and Q.

*i.e.* 
$$m\left(\frac{KA}{2m}\right)$$
 = Limiting friction

$$\therefore$$
 Maximum friction =  $\frac{KA}{2}$ 

(c) Normal reaction  $R = mg - P \sin 30^\circ = mg - \frac{P}{2}$ 

 $\therefore$  Limiting friction between body and surface is given by,

$$F = \mu R = \mu \left( mg - \frac{P}{2} \right).$$

**8.** (a) Limiting friction between block and slab =  $\mu_s m_A g$ 

$$=0.6 \times 10 \times 9.8 = 58.8 N$$

But applied force on block A is 100 N. So the block will slip over a slab.

Now kinetic friction works between block and slab  $F_k = \mu_k m_A g = 0.4 \times 10 \times 9.8 = 39.2 \ N$ 

This kinetic friction helps to move the slab

:. Acceleration of slab = 
$$\frac{39.2}{m_B} = \frac{39.2}{40} = 0.98 \ m / s^2$$

**9.** (a) Limiting friction  $F_l = \mu \, mg \cos \theta$ 

$$F_1 = 0.7 \times 2 \times 10 \times \cos 30^\circ = 12 \ N$$
 (approximately)

But when the block is lying on the inclined plane then component of weight down the plane  $= mg \sin\theta$ 

$$= 2 \times 9.8 \times \sin 30^{\circ} = 9.8 N$$

It means the body is stationary, so static friction will work on it

 $\therefore$  Static friction = Applied force = 9.8 N

- 10. (a,c) In cycling, the rear wheel moves by the force communicated to it by pedalling while front wheel moves by it self. So, while pedalling a bicycle, the force exerted by rear wheel on ground makes force of friction act on it in the forward direction (like walking). Front wheel moving by itself experience force of friction in backward direction (like rolling of a ball). [However, if pedalling is stopped both wheels move by themselves and so experience force of friction in backward direction].
- **11.** (a)

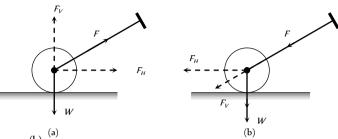

#### Assertion & Reason

- (a) On a rainy day, the roads are wet. Wetting of roads lowers the coefficient of friction between the tyres and the road. Therefore, grip of car on the road reduces and thus chances of skidding increases.
- 2. (e) When a bicycle is in motion, two cases may arise :
  - (i) When the bicycle is being pedalled. In this case, the applied force has been communicated to rear wheel. Due to which the rear wheel pushes the earth backwards. Now the force of friction acts in the forward direction on the rear wheel but front wheel move forward due to inertia, so force of friction works on it in backward direction
  - (ii) When the bicycle is not being pedalled :

In this case both the wheels move in forward direction, due to inertia. Hence force of friction on both the wheels acts in backward direction.

3. (a) Suppose the roller is pushed as in figure (b). The force F is resolved into two components, horizontal component F which helps the roller to move forward, and the vertical component acting downwards adds to the weight. Thus weight is increased. But in the case of pull [fig (a)] the vertical component is

opposite to its weight. Thus weight is reduced. So pulling is easier than pushing the lawn roller.

- **4.** (b)
- **5.** (d) The force acting on the body of mass *M* are its weight *Mg* acting vertically downwards and air resistance *F* acting vertically upward.

$$\therefore$$
 Acceleration of the body,  $a = \frac{Mg - F}{M} = g - \frac{F}{M}$ 

Now, M > m, therefore, the body with larger mass will have greater acceleration and it will reach the ground first.

- 6. (d) Only static friction is a self adjusting force. This is because force of static friction is equal and opposite to applied force (so long as actual motion does not start). Frictional force = μmg i.e. friction depends on mass.
- **7.** (a)
- **8.** (d) Acceleration down a rough inclined plane  $a = g(\sin\theta \mu\cos\theta)$  and this is less than g.
